

Package ‘DJL’

January 20, 2025

Type Package

Title Distance Measure Based Judgment and Learning

Version 3.9

Date 2023-03-16

Author Dong-Joon Lim, Ph.D. <technometrics.org>

Depends R (>= 3.4.0), car, lpSolveAPI

Maintainer Dong-Joon Lim <tgn03.com@gmail.com>

Description Implements various decision support tools related to the Econometrics & Technometrics.

Subroutines include correlation reliability test, Mahalanobis distance measure for outlier detection, combinatorial search (all possible subset regression), non-parametric efficiency analysis measures: DDF (directional distance function), DEA (data envelopment analysis), HDF (hyperbolic distance function), SBM (slack-based measure), and SF (shortage function), benchmarking, Malmquist productivity analysis, risk analysis, technology adoption model, new product target setting, network DEA, dynamic DEA, intertemporal budgeting, etc.

dataset.airplane.2017 *Dataset of commercial airplanes from 1965 to 2017.*

Description

Commercial airplanes from 1965 to 2017.

Usage

```
data(dataset.airplane.2017)
```

Columns

- [,1] Name Airplane name
- [,2] EIS Entry into service
- [,3] Range Maximum range at full payload in 1,000km
- [,4] P.cap Passenger capacity
- [,5] PFE Passenger fuel efficiency in passengers*km/L (log scale)
- [,6] C.spd Cruising speed in km/hr
- [,7] M.spd Maximum speed in km/hr

Examples

```
# Load dataset
data(dataset.airplane.2017)
```

dataset.engine.2015 *Dataset of auto engines from MY2005 to MY2015.*

Description

Auto engines from MY2005 to MY2015.

Usage

```
data(dataset.engine.2015)
```

Columns

- [,1] Name Vehicle name
- [,2] MY Model year
- [,3] Cylinder The number of cylinder
- [,4] Displacement Displacement in liter
- [,5] CO2 CO2 emission in gram/mile
- [,6] Power Engine power in HP
- [,7] Torque Engine torque in lb.ft
- [,8] Type Engine system and fuel type

```

dataset.hev.2013

Dataset of hybrid electric vehicles from MY1997 to MY2013.

Description

Hybrid electric vehicles from MY1997 to MY2013.

Usage

```
data(dataset.hev.2013)
```

Columns

- [,1] Name Vehicle name
- [,2] MY Model year
- [,3] MSRP.2013 MSRP converted to 2013 value
- [,4] Acc Acceleration (0-100km) in km/h/s
- [,5] MPG MPG in mile/gallon
- [,6] MPGe MPG equivalence for PHEV in mile/gallon

```

dm.ddf	<i>Distance measure using DDF</i>
--------	-----------------------------------

Description

Implements *Chambers*' directional distance function (non-radial & non-oriented measure).

Usage

```
dm.ddf(xdata, ydata, rts="crs", g=NULL,
       wd=NULL, se=FALSE, sg="ssm", date=NULL, cv="convex", o=NULL)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
g	Directional vector indicating a measurement direction (n by $(m+s)$) By default (NULL), xdata & ydata will be used
wd	Weak disposability vector indicating (an) undesirable output(s) (l by s)
se	Implements super-efficiency model alike <i>Anderson & Peterson</i> 's model if TRUE
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
date	Production date (n by l)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
o	DMU index to calc. NULL(default) will calc for all

Value

\$eff	Efficiency score
\$lambda	Intensity vector
\$mu	Secondary intensity vector for weak disposability under VRS
\$beta	Input reduction factor
\$gamma	Output augmentation factor
\$xslack	Input slack
\$yslack	Output slack

Author(s)

Dong-Joon Lim, PhD

[dm.sf](#) Distance measure using SF

Examples

```
# Additive form directional distance function
# ready
x <- matrix(c(5, 1, 4), ncol = 1)
y <- matrix(c(8, 3, 5, 6, 4, 1), ncol = 2)
g <- matrix(c(1), nrow = 3, ncol = 3)
w <- matrix(c(1, 0), ncol = 2)
# go
dm.ddf(x, y, "crs", g, w)

# Multiplicative form directional distance function
# ready
g <- cbind(x, y)
# go
dm.ddf(x, y, "crs", g, w)
```

dm.dea

Distance measure using DEA

Description

Implements Charnes & Cooper's data envelopment analysis (radial & oriented measure).

Usage

```
dm.dea(xdata, ydata, rts="crs", orientation,
       se=FALSE, sg="ssm", date=NULL, ncv=NULL, env=NULL, cv="convex", o=NULL)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "i" Input-orientation "o" Output-orientation
se	Implements Andersen & Petersen's super-efficiency model if TRUE
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
date	Production date (n by l)
ncv	Non-controllable variable index(binary) for internal NDF (l by $(m+s)$)
env	Environment index for external NDF (n by l)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
o	DMU index to calc. NULL(default) will calc for all

Value

\$eff	Efficiency score
\$lambda	Intensity vector
\$xslack	Input slack
\$yslack	Output slack
\$vx	Input (dual) weight
\$uy	Output (dual) weight
\$w	Free (dual) variable

Examples

```
# Reproduce Table 3.9 (p.348) in Fried, H.O. et al.(2008)
# ready
X <- data.frame(x1 = c(8, 6, 3, 10, 6, 8, 8, 4),
                 x2 = c(8, 4.6, 1.9, 9, 3.6, 3.6, 9, 1.9))
Y <- data.frame(y1 = c(8, 5, 2, 9, 4.5, 4.5, 7, 2))
C <- data.frame(x1 = 0, x2 = 1, y1 = 0)

# go
data.frame(ALL_CRS = dm.dea(X, Y, "crs", "i")$eff,
           ALL_VRS = dm.dea(X, Y, "vrs", "i")$eff,
           NDF_CRS = dm.dea(X, Y, "crs", "i", ncv = C)$eff,
           NDF_VRS = dm.dea(X, Y, "vrs", "i", ncv = C)$eff,
           row.names = LETTERS[1 : 8])
```

Description

Employs the Farrell measure on carry-over budget as well as input or output

Usage

```
dm.dynamic.bc(xdata, ydata, zdata, bdata, rts="crs", orientation="i", wv=NULL)
```

Arguments

xdata	Input array (n by m by t)
ydata	Output array (n by s by t)
zdata	Budget(spent) array (n by b by t)
bdata	Budget(secured) array (n by b)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "i" Input-orientation (default) "o" Output-orientation
wv	Weight vector for scalarization (I by m or s)

Value

\$eff.s	System Efficiency
\$eff.t	Period Efficiency
\$lambda	Intensity vectors
\$xslack	Input slack
\$yslack	Output slack
\$zslack	Budget(spent) slack
\$asslack	Budget(available) slack

                 c(4, 3, 2),
                 dimnames = list(LETTERS[1:4], c("X", "Y", "z"), c("t1", "t2")))
df.Z.0 <- array(c(9, 12, 18, 24), c(4, 1), dimnames = list(LETTERS[1:4], c("Z^0")))
```

```
# Run
dm.dynamic.bc(df.io[,1,], df.io[,2,], df.io[,3,], df.Z.0)
```

dm.hdf*Distance measure using HDF***Description**

Implements *Fare's* hyperbolic distance function (semi-radial & non-oriented measure).

Usage

```
dm.hdf(xdata, ydata, rts="crs",
        wd=NULL, se=FALSE, sg="ssm", date=NULL, cv="convex", o=NULL)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
wd	Weak disposability vector indicating (an) undesirable output(s) (I by s)
se	Implements super-efficiency model alike <i>Anderson & Peterson's</i> model if TRUE
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
date	Production date (n by I)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
o	DMU index to calc. NULL(default) will calc for all

Value

\$eff	Efficiency score
\$lambda	Intensity vector
\$mu	Secondary intensity vector for weak disposability under VRS
\$xslack	Input slack
\$yslack	Output slack
\$iteration	The number of iteration to obtain the hyperbolic efficiency score

Examples

```
# Reproduce Table 2 in Fare et al.(2016)
# ready
x <- data.frame(x1 = c(2, 4, 9, 6.5, 10, 6, 9))
y <- data.frame(y1 = c(3, 7, 10, 8.5, 4, 2, 8))

# go
sf <- dm.sf (x, y, "vrs")$eff
hdf <- dm.hdf(x, y, "vrs")$eff
matrix(t(cbind(sf, hdf)), 2, 7,
       dimnames = list(c("SF", "HDF"),
                       paste0("DMU_", c(letters[1:4], "o", "p", "q"))))
```

Description

Implements *Mahalanobis* distance measure for outlier detection. In addition to the basic distance measure, boxplots are provided with potential outlier(s) to give an insight into the early stage of data cleansing task.

Usage

```
dm.mahalanobis(data, from="median", p=10, plot=FALSE, v.index=NULL, layout=NULL)
```

Arguments

data	Dataframe
from	Datum point from which the distance is measured "mean" Mean of each column "median" Median of each column (default)
p	Percentage to which outlier point(s) is noted (default of 10)
plot	Switch for boxplot(s)
v.index	Numeric vector indicating column(s) to be printed in the boxplot. Default value of NULL will present all.
layout	Numeric vector indicating dimension of boxplots. Default value of NULL will find an optimal layout.

Value

\$dist	Mahalanobis distance from from
\$excluded	Excluded row(s) in row number
\$order	Distance order (decreasing) in row number
\$suspect	Potential outlier(s) in row number

Examples

```
# Generate a sample dataframe
df <- data.frame(replicate(6, sample(0 : 100, 50)))

# go
dm.mahalanobis(df, plot = TRUE)
```

Description

Implements *Charnes & Cooper's* data envelopment analysis (radial & oriented measure) on a two-stage network structure.

Usage

```
dm.network.dea(xdata.s1, ydata.s1=NULL, zdata, xdata.s2=NULL, ydata.s2,
                rts="crs", orientation="i", type="nc", leader="1st", ss=10^-4, o=NULL)
```

Arguments

xdata.s1	Input(s) vector in Stage 1 (<i>n</i> by <i>m.s1</i>)
ydata.s1	Output(s) vector in Stage 1 (<i>n</i> by <i>s.s1</i>)
zdata	Intermediate product(s) vector between Stage 1 and Stage 2 (<i>n</i> by <i>p</i>)
xdata.s2	Input(s) vector in Stage 2 (<i>n</i> by <i>m.s2</i>)
ydata.s2	Output(s) vector in Stage 2 (<i>n</i> by <i>s.s2</i>)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "i" Input-orientation (default) "o" Output-orientation
type	Solution method "nc" Decentralized model (Stackelberg game approach) (default) "co" Centralized model (cooperative game approach)
leader	Preemptive priority for Decentralized model "1st" 1st stage as the leader (default) "2nd" 2nd stage as the leader
ss	Step size for heuristic search 10^{-4} (default)
o	DMU index to operate. NULL (default) will operate for all

Value

\$eff.s1	Efficiency score of Stage 1
\$eff.s2	Efficiency score of Stage 2
\$v.s1	Weight attached to input in Stage 1
\$u.s1	Weight attached to output in Stage 1
\$p	Weight attached to intermediate product
\$w.s1	Free variable for scaling in Stage 1
\$v.s2	Weight attached to input in Stage 2
\$u.s2	Weight attached to output in Stage 2
\$w.s2	Free variable for scaling in Stage 2

dm.sbm*Distance measure using SBM***Description**

Implements *Tone's* slack-based model (non-radial & (non-)oriented measure).

Usage

```
dm.sbm(xdata, ydata, rts="crs",
        orientation="n", se=FALSE, sg="ssm", date=NULL, cv="convex", o=NULL)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "n" Non-orientation (default) "i" Input-orientation "o" Output-orientation
se	Implements super-efficiency model alike <i>Anderson & Peterson's</i> model if TRUE
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
date	Production date (n by 1)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
o	DMU index to calc. NULL(default) will calc for all

Value

\$eff	Efficiency score
\$lambda	Intensity vector
\$xslack	Input slack
\$yslack	Output slack
\$xtarget	Input target
\$ytarget	Output target

<code>dm.sf</code>	<i>Distance measure using SF</i>
--------------------	----------------------------------

Description

Implements Luenberger's shortage (benefit) function (radial & non-oriented measure).

Usage

```
dm.sf(xdata, ydata, rts="crs", g=NULL,
      wd=NULL, se=FALSE, sg="ssm", date=NULL, cv="convex", o=NULL)
```

Arguments

<code>xdata</code>	Input(s) vector (n by m)
<code>ydata</code>	Output(s) vector (n by s)
<code>rts</code>	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
<code>g</code>	Directional vector indicating a measurement direction (n by $(m+s)$) By default (NULL), <code>xdata</code> & <code>ydata</code> will be used
<code>wd</code>	Weak disposability vector indicating (an) undesirable output(s) (l by s)
<code>se</code>	Implements super-efficiency model alike <i>Anderson & Peterson</i> 's model if TRUE
<code>sg</code>	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if <code>date</code> is defined) "min" Date-sum minimization (only if <code>date</code> is defined)
<code>date</code>	Production date (n by l)
<code>cv</code>	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override <code>rts</code>)
<code>o</code>	DMU index to calc. NULL(default) will calc for all

Value

<code>\$eff</code>	Efficiency score
<code>\$lambda</code>	Intensity vector
<code>\$mu</code>	Secondary intensity vector for weak disposability under VRS
<code>\$xslack</code>	Input slack
<code>\$yslack</code>	Output slack
<code>\$w</code>	Input (dual) weight
<code>\$p</code>	Output (dual) weight
<code>\$u</code>	Free (dual) variable

- [dm.sf](#) Distance measure using SF

Examples

```
# Additive form shortage function
# ready
x <- matrix(c(5, 1, 4), ncol = 1)
y <- matrix(c(8, 3, 5, 6, 4, 1), ncol = 2)
g <- matrix(c(1), nrow = 3, ncol = 3)
w <- matrix(c(1, 0), ncol = 2)
# go
dm.sf(x, y, "crs", g, w)

# Multiplicative form shortage function
# ready
g <- cbind(x, y)
# go
dm.sf(x, y, "crs", g, w)
```

Description

Implements combinatorial (exhaustive) search algorithm, aka all-possible-subsets regression. As opposed to the sequential approach (stepwise, forward addition, or backward elimination) that has a potential bias resulting from considering only one variable for selection at a time, all possible combinations of the independent variables are examined, and sets satisfying designated conditions are returned.

Usage

```
ma.aps.reg(dv, iv, min=1, max, mad=FALSE, aic=FALSE, bic=FALSE,
           model.sig=TRUE, coeff.sig=TRUE, coeff.vif=TRUE, coeff.cor=FALSE)
```

Arguments

dv	Dependent variable (r by I)
iv	Independent variable(s) (r by c)
min	Minimum number of independent variable to explore ($>=I$)
max	Maximum number of independent variable to explore ($<=r/10$)
mad	Returns mean absolute deviation when TRUE
aic	Returns Akaike's information criterion when TRUE
bic	Returns Bayesian information criterion when TRUE
model.sig	Returns models statistically significant only when TRUE
coeff.sig	Returns models with statistically significant coefficients only when TRUE
coeff.vif	Returns models with allowable level of multicollinearity only when TRUE
coeff.cor	Returns models without suppression effects only when TRUE

Examples

```
# Load airplane dataset
df <- dataset.airplane.2017

# ready
dv <- subset(df, select = 2)
iv <- subset(df, select = 3 : 7)

# go
ma.aps.reg(dv, iv, 1, 3, mad = TRUE, coeff.cor = TRUE)
```

map.corr*Correlation mapping for reliability test*

Description

Implements a series of correlation analysis by dropping extreme data points one by one using *Mahalanobis* distance measure. Correlation reliability can be investigated with identified anchoring point(s). Correlation map as well as summary table is provided.

Usage

```
map.corr(data, from = "median", threshold = 0.3, r.name = FALSE)
```

Arguments

<code>data</code>	Dataframe
<code>from</code>	Datum point from which the distance is measured "mean" Mean of each column "median" Median of each column (default)
<code>threshold</code>	Threshold of correlation change to be noted on the map
<code>r.name</code>	Dropped points are shown in row name when TRUE

Value

`$reliability` Summary table

```

<code>map.soa.ddf</code>	<i>SOA mapping using DDF</i>
--------------------------	------------------------------

Description

Employs `dm.ddf` over time to generate a state-of-the-art map.

Usage

```
map.soa.ddf(xdata, ydata, date,
             rts="crs", g=NULL, wd=NULL, sg="ssm", cv="convex", mk="dmu")
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by I)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
g	Directional vector indicating a measurement direction (n by $(m+s)$) By default (NULL), xdata & ydata will be used
wd	Weak disposability vector indicating (an) undesirable output(s) (I by s)
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
mk	Marker on the map "dmu" DMU index (default) "eff" Efficiency score

# Load engine dataset
df <- dataset.engine.2015

# Subset for forced induction systems
fis <- subset(df, grepl("^C..", df[, 8]))

# Parameters
x <- subset(fis, select = 4)
y <- subset(fis, select = 6 : 7)
d <- subset(fis, select = 2)
g <- matrix(c(1), nrow = nrow(x), ncol = 3)

# Generate an SOA map
map.soa.ddf(x, y, d, "crs", g)
```

map.soa.dea

SOA mapping using DEA

Description

Employs dm.dea over time to generate a state-of-the-art map.

Usage

```
map.soa.dea(xdata, ydata, date, rts="crs", orientation,
            sg="ssm", ncv=NULL, env=NULL, cv="convex", mk="dmu")
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by 1)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "i" Input-orientation "o" Output-orientation
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
ncv	Non-controllable variable index(binary) for internal NDF (I by $(m+s)$)

env	Environment index for external NDF (n by I)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
mk	Marker on the map "dmu" DMU index (default) "eff" Efficiency score

# Generate an SOA map
map.soa.dea(x, y, d, "crs", "o")
```

map.soa.hdf

SOA mapping using HDF

Description

Employs `dm.hdf` over time to generate a state-of-the-art map.

Usage

```
map.soa.hdf(xdata, ydata, date,
            rts="crs", wd=NULL, sg="ssm", cv="convex", mk="dmu")
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by 1)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
wd	Weak disposability vector indicating (an) undesirable output(s) (I by s)
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)

# Generate an SOA map
map.soa.hdf(x, y, d, "vrs")

```

map.soa.sbm

SOA mapping using SBM

Description

Employs SBM over time to generate a state-of-the-art map.

Usage

```
map.soa.sbm(xdata, ydata, date,
             rts="crs", orientation="n", sg="ssm", cv="convex", mk="dmu")
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by 1)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "n" Non-orientation (default) "i" Input-orientation "o" Output-orientation
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)

map.soa.sf*SOA mapping using SF***Description**

Employs `dml.sf` over time to generate a state-of-the-art map.

Usage

```
map.soa.sf(xdata, ydata, date,
            rts="crs", g=NULL, wd=NULL, sg="ssm", cv="convex", mk="dmu")
```

Arguments

<code>xdata</code>	Input(s) vector (n by m)
<code>ydata</code>	Output(s) vector (n by s)
<code>date</code>	Production date (n by 1)
<code>rts</code>	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
<code>g</code>	Directional vector indicating a measurement direction (n by $(m+s)$) By default (NULL), <code>xdata</code> & <code>ydata</code> will be used

<code>wd</code>	Weak disposability vector indicating (an) undesirable output(s) (I by s)
<code>sg</code>	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization (only if date is defined) "min" Date-sum minimization (only if date is defined)
<code>cv</code>	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override <code>rts</code>)
<code>mk</code>	Marker on the map "dmu" DMU index (default) "eff" Efficiency score

```

<code>plp</code>	<i>Print LP object</i>
------------------	------------------------

Description

Print an LP object line by line.

Usage

```
plp(x)
```

Arguments

<code>x</code>	LP object defined by make.lp function in lpSolve library
----------------	--

Author(s)

Dong-Joon Lim, PhD

References

Berkelaar, Michel, Kjell Eikland, and Peter Notebaert. "Ipsolve: Open source (mixed-integer) linear programming system." *Eindhoven U. of Technology* 63 (2004).

Examples

```
# Declare an LP object
lp.temp <- make.lp(0, 61)

# Print the LP
plp(lp.temp)
```

<code>roc.dea</code>	<i>Rate of change (RoC) calculation using DEA</i>
----------------------	---

Description

Employs dm.dea over time to calculate RoCs.

Usage

```
roc.dea(xdata, ydata, date, t, rts="crs", orientation,
        sg="ssm", ftype="d", ncv=NULL, env=NULL, cv="convex")
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by l)
t	A vantage point from which the RoC is captured
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "i" Input-orientation "o" Output-orientation
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization "min" Date-sum minimization
ftype	Frontier type "d" Dynamic frontier (default) "s" Static frontier
ncv	Non-controllable variable index(binary) for internal NDF (l by $(m+s)$)
env	Environment index for external NDF (n by l)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)

Value

\$eff_r	Efficiency at release (i.e., at each production date)
\$eff_t	Efficiency at t
\$lambda_t	Intensity vector at t
\$eft_date	Effective date
\$roc_past	RoC observed from the obsolete DMUs in the past
\$roc_avg	Average RoC
\$roc_local	Local RoC

```

roc.sf

Rate of change (RoC) calculation using SF

Description

Employs `dm.sf` over time to calculate RoCs. This function is valid only when multiplicative form of directional vector is used.

Usage

```
roc.sf(xdata, ydata, date, t,
       rts="crs", g=NULL, wd=NULL, sg="ssm", ftype="d", cv="convex")
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by I)
t	A vantage point from which the RoC is captured

rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
g	Directional vector indicating a measurement direction (n by $(m+s)$) By default (NULL), xdata & ydata will be used
wd	Weak disposability vector indicating (an) undesirable output(s) (l by s)
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization "min" Date-sum minimization
ftype	Frontier type "d" Dynamic frontier (default) "s" Static frontier
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)

Value

\$eff_r	Efficiency at release (i.e., at each production date)
\$eff_t	Efficiency at t
\$lambda_t	Intensity vector at t
\$eft_date	Effective date
\$roc_past	RoC observed from the obsolete DMUs in the past
\$roc_avg	Average RoC
\$roc_local	Local RoC

Examples

```
# Reproduce Mercedes-Benz CLA45 AMG's local RoC in Table 5 in Lim, D-J. (2015)
# Load engine dataset
df <- dataset.engine.2015

# Subset for 4 cylinder engines
fce <- subset(df, df[, 3] == 4)

# Parameters
x <- subset(fce, select = 4)
y <- subset(fce, select = 5 : 7)
d <- subset(fce, select = 2)
g <- as.matrix(data.frame(0, y))
w <- matrix(c(1, 0, 0), ncol = 3)

# Calc local Roc
roc.sf(x, y, d, 2014, "crs", g, w, "min")$roc_local[348, ]
```

target.arrival.dea *Arrival target setting using DEA*

Description

Employs dm.dea over time to estimate the arrival of known specifications.

Usage

```
target.arrival.dea(xdata, ydata, date, t, rts="crs", orientation,
                    sg="ssm", ftype="d", ncv=NULL, env=NULL, cv="convex", anc=FALSE)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by 1)
t	A vantage point from which the RoC is captured
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
orientation	Orientation of the measurement "i" Input-orientation "o" Output-orientation

<code>sg</code>	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization "min" Date-sum minimization
<code>ftype</code>	Frontier type "d" Dynamic frontier (default) "s" Static frontier
<code>ncv</code>	Non-controllable variable index(binary) for internal NDF (I by $(m+s)$)
<code>env</code>	Environment index for external NDF (n by I)
<code>cv</code>	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override <code>rts</code>)
<code>anc</code>	Implements a stepwise RoC computation if TRUE

Value

<code>\$eff_t</code>	Efficiency at t
<code>\$lambda_t</code>	Intensity vector at t
<code>\$eft_date</code>	Effective date
<code>\$roc_avg</code>	Average RoC
<code>\$roc_anc</code>	Local RoCs across the periods
<code>\$roc_local</code>	Local RoC
<code>\$roc_ind</code>	Individualized RoC
<code>\$arrival_avg</code>	Estimated arrival using <code>roc_avg</code>
<code>\$arrival_seg</code>	Estimated arrival using <code>roc_ind</code>

```

target.arrival.hdf *Arrival target setting using HDF*

Description

Employs dm.hdf over time to estimate the arrival of known specifications.

Usage

```
target.arrival.hdf(xdata, ydata, date, t, rts="crs",
                    wd=NULL, sg="ssm", ftype="d", cv="convex", anc=FALSE)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by 1)
t	A vantage point from which the RoC is captured
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS

```

target.spec.dea	<i>Spec target setting using DEA</i>
-----------------	--------------------------------------

Description

Employs inverse DEA to estimate specifications(in/out-puts) to achieve a predetermined efficiency.

Usage

```
target.spec.dea(xdata, ydata, date=NULL, t=NULL, dt=NULL, dmu, et="c",
                 alpha=NULL, beta=NULL, wv=NULL, rts="crs", sg="ssm", ftype="d",
                 ncv=NULL, env=NULL, cv="convex", bound=TRUE, pin=TRUE)
```

Arguments

xdata	Input(s) vector (n by m)
ydata	Output(s) vector (n by s)
date	Production date (n by 1)
t	A vantage point from which the RoC is captured
dt	Delta t i.e., specs are estimated within PPS at $t+dt$
dmu	DMU whose inputs(or outputs) are to be estimated
et	Efficiency target; default value ("c") retains the current efficiency
alpha	Perturbed input(s) of designated DMU (l by m)
beta	Perturbed output(s) of designated DMU (l by s)
wv	Weight vector for scalarization (l by m or s)
rts	Returns to scale assumption "crs" Constant RTS (default) "vrs" Variable RTS "irs" Increasing RTS "drs" Decreasing RTS
sg	Employs second-stage optimization "ssm" Slack-sum maximization (default) "max" Date-sum maximization "min" Date-sum minimization
ftype	Frontier type "d" Dynamic frontier (default) "s" Static frontier
ncv	Non-controllable variable index(binary) for internal NDF (l by $(m+s)$)
env	Environment index for external NDF (n by l)
cv	Convexity assumption "convex" Convexity holds (default) "fdh" Free disposal hull (this will override rts)
bound	Puts upper/lower bounds on alpha/beta if TRUE(default)
pin	Includes the perturbed DMU in the PPS if TRUE(default)

Value

\$alpha	Estimated input(s)
\$beta	Estimated output(s)
\$lambda	Intensity vector
\$xslack	Input slack
\$yslack	Output slack
