

Package ‘tidyllm’

March 27, 2025

Title Tidy Integration of Large Language Models

Version 0.3.4

Description A tidy interface for integrating large language model (LLM) APIs such as 'Claude', 'Openai', 'Gemini', 'Mistral' and local models via 'Ollama' into R workflows. The package supports text and media-based interactions, interactive message history, batch request APIs, and a tidy, pipeline-oriented interface for streamlined integration into data workflows. Web services are available at <<https://www.anthropic.com>>, <<https://openai.com>>, <<https://aistudio.google.com/>>, <<https://mistral.ai/>> and <<https://ollama.com>>.

azure_openai	<i>Azure OpenAI Endpoint Provider Function</i>
--------------	--

Description

The `azure_openai()` function acts as an interface for interacting with the Azure OpenAI API through main `tidyllm` verbs.

Usage

```
azure_openai(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the Azure OpenAI API specific function, such as model configuration, input text, or API-specific options.
.called_from	An internal argument that specifies which action (e.g., <code>chat</code>) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Details

`azure_openai()` currently routes messages only to `azure_openai_chat()` when used with `chat()`. `send_batch()`. It dynamically routes requests to OpenAI-specific functions like `azure_openai_chat()` and `azure_openai_embedding()` based on the context of the call.

Value

The result of the requested action, depending on the specific function invoked (currently, only an updated `LLMMessage` object for `azure_openai_chat()`).

azure_openai_chat	<i>Send LLM Messages to an Azure OpenAI Chat Completions endpoint</i>
-------------------	---

Description

This function sends a message history to the Azure OpenAI Chat Completions API and returns the assistant's reply.

Usage

```
azure_openai_chat(  
    .llm,  
    .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),  
    .deployment = "gpt-4o-mini",  
    .api_version = "2024-08-01-preview",  
    .max_completion_tokens = NULL,  
    .reasoning_effort = NULL,  
    .frequency_penalty = NULL,  
    .logit_bias = NULL,  
    .presence_penalty = NULL,  
    .seed = NULL,  
    .stop = NULL,  
    .stream = FALSE,  
    .temperature = NULL,  
    .top_p = NULL,  
    .timeout = 60,  
    .verbose = FALSE,  
    .json_schema = NULL,  
    .max_tries = 3,  
    .dry_run = FALSE,  
    .logprobs = NULL,  
    .top_logprobs = NULL,  
    .tools = NULL,  
    .tool_choice = NULL  
)
```

Arguments

.llm	An LLMMessages object containing the conversation history.
.endpoint_url	Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
.deployment	The identifier of the model that is deployed (default: "gpt-4o-mini").
.api_version	Which version of the API is deployed (default: "2024-08-01-preview").
.max_completion_tokens	An upper bound for the number of tokens that can be generated for a completion.
.reasoning_effort	How long should reasoning models reason (can either be "low","medium" or "high").
.frequency_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
.logit_bias	A named list modifying the likelihood of specified tokens appearing in the completion.
.presence_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.

.seed	If specified, the system will make a best effort to sample deterministically.
.stop	Up to 4 sequences where the API will stop generating further tokens.
.stream	If set to TRUE, the answer will be streamed to console as it comes (default: FALSE).
.temperature	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
.top_p	An alternative to sampling with temperature, called nucleus sampling.
.timeout	Request timeout in seconds (default: 60).
.verbose	Should additional information be shown after the API call (default: FALSE).
.json_schema	A JSON schema object provided by tidyllm schema or ellmer schemata.
.max_tries	Maximum retries to perform request.
.dry_run	If TRUE, perform a dry run and return the request object (default: FALSE).
.logprobs	If TRUE, get the log probabilities of each output token (default: NULL).
.top_logprobs	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.tool_choice	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required".

Value

A new LLMMessages object containing the original messages plus the assistant's response.

azure_openai_embedding

Generate Embeddings Using OpenAI API on Azure

Description

Generate Embeddings Using OpenAI API on Azure

Usage

```
azure_openai_embedding(
  .input,
  .deployment = "text-embedding-3-small",
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
  .api_version = "2023-05-15",
  .truncate = TRUE,
  .timeout = 120,
  .dry_run = FALSE,
  .max_tries = 3
)
```

Arguments

.input	A character vector of texts to embed or an LLMMessageobject
.deployment	The embedding model identifier (default: "text-embedding-3-small").
.endpoint_url	Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
.api_version	What API-Version othe Azure OpenAI API should be used (default: "2023-05-15")
.truncate	Whether to truncate inputs to fit the model's context length (default: TRUE).
.timeout	Timeout for the API request in seconds (default: 120).
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retry attempts for requests (default: 3).

Value

A tibble with two columns: `input` and `embeddings`. The `input` column contains the texts sent to embed, and the `embeddings` column is a list column where each row contains an embedding vector of the sent input.

cancel_openai_batch *Cancel an In-Progress OpenAI Batch*

Description

This function cancels an in-progress batch created through the OpenAI API. The batch will be moved to a "cancelling" state and, eventually, "cancelled."

Usage

```
cancel_openai_batch(.batch_id, .dry_run = FALSE, .max_tries = 3, .timeout = 60)
```

Arguments

.batch_id	Character; the unique identifier for the batch to cancel.
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list containing the response from the OpenAI API about the cancellation status.

chat	<i>Chat with a Language Model</i>
------	-----------------------------------

Description

The `chat()` function sends a message to a language model via a specified provider and returns the response. It routes the provided `LLMMessage` object to the appropriate provider-specific chat function, while allowing for the specification of common arguments applicable across different providers.

Usage

```
chat(
  .llm,
  .provider = getOption("tidyllum_chat_default"),
  .dry_run = NULL,
  .stream = NULL,
  .temperature = NULL,
  .timeout = NULL,
  .top_p = NULL,
  .max_tries = NULL,
  .model = NULL,
  .verbose = NULL,
  .json_schema = NULL,
  .tools = NULL,
  .seed = NULL,
  .stop = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL
)
```

Arguments

<code>.llm</code>	An <code>LLMMessage</code> object containing the message or conversation history to send to the language model.
<code>.provider</code>	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllum_chat_default</code> option.
<code>.dry_run</code>	Logical; if TRUE, simulates the request without sending it to the provider. Useful for testing.
<code>.stream</code>	Logical; if TRUE, streams the response from the provider in real-time.
<code>.temperature</code>	Numeric; controls the randomness of the model's output (0 = deterministic).
<code>.timeout</code>	Numeric; the maximum time (in seconds) to wait for a response.
<code>.top_p</code>	Numeric; nucleus sampling parameter, which limits the sampling to the top cumulative probability p.

.max_tries	Integer; the maximum number of retries for failed requests.
.model	Character; the model identifier to use (e.g., "gpt-4").
.verbose	Logical; if TRUE, prints additional information about the request and response.
.json_schema	List; A JSON schema object as R list to enforce the output structure
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.seed	Integer; sets a random seed for reproducibility.
.stop	Character vector; specifies sequences where the model should stop generating further tokens.
.frequency_penalty	Numeric; adjusts the likelihood of repeating tokens (positive values decrease repetition).
.presence_penalty	Numeric; adjusts the likelihood of introducing new tokens (positive values encourage novelty).

Details

The `chat()` function provides a unified interface for interacting with different language model providers. Common arguments such as `.temperature`, `.model`, and `.stream` are supported by most providers and can be passed directly to `chat()`. If a provider does not support a particular argument, an error will be raised.

Advanced provider-specific configurations can be accessed via the provider functions.

Value

An updated `LLMMessage` object containing the response from the language model.

Examples

```
## Not run:  
# Basic usage with OpenAI provider  
llm_message("Hello World") |>  
  chat(ollama(.ollama_server = "https://my-ollama-server.de"), .model="mixtral")  
  
  chat(mistral,.model="mixtral")  
  
# Use streaming with Claude provider  
llm_message("Tell me a story") |>  
  chat(claude(),.stream=TRUE)  
  
## End(Not run)
```

chatgpt*Alias for the OpenAI Provider Function***Description**

The chatgpt function is an alias for the openai() provider function. It provides a convenient way to interact with the OpenAI API for tasks such as sending chat messages, generating embeddings, and handling batch operations using tidyllm verbs like chat(), embed(), and send_batch().

Usage

```
chatgpt(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate OpenAI-specific function, such as model configuration, input text, or other API-specific options.
.called_from	An internal argument that specifies the context (e.g., chat, embed, send_batch) in which the function is being invoked. This is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated LMMMessage object for chat(), or a matrix for embed()).

check_azure_openai_batch*Check Batch Processing Status for Azure OpenAI Batch API***Description**

This function retrieves the processing status and other details of a specified Azure OpenAI batch ID from the Azure OpenAI Batch API.

Usage

```
check_azure_openai_batch(
  .llms = NULL,
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
  .batch_id = NULL,
  .dry_run = FALSE,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

- .llms A list of LLMMessages objects.
- .endpoint_url Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
- .batch_id A manually set batch ID.
- .dry_run Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
- .max_tries Maximum retries to perform the request (default: 3).
- .timeout Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

check_batch	<i>Check Batch Processing Status</i>
-------------	--------------------------------------

Description

This function retrieves the processing status and other details of a specified batchid or a list of LLMMessages objects with batch attribute. It routes the input to the appropriate provider-specific batch API function.

Usage

```
check_batch(
  .llms,
  .provider = getOption("tidyllm_cbatch_default"),
  .dry_run = NULL,
  .max_tries = NULL,
  .timeout = NULL
)
```

Arguments

- .llms A list of LLMMessages objects or a character vector with a batch ID.
- .provider A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like openai(), claude(), etc. You can also set a default provider function via the `tidyllm_cbatch_default` option.
- .dry_run Logical; if TRUE, returns the prepared request object without executing it
- .max_tries Maximum retries to perform the request
- .timeout Integer specifying the request timeout in seconds

Value

A tibble with information about the status of batch processing.

`check_claude_batch` *Check Batch Processing Status for Claude API*

Description

This function retrieves the processing status and other details of a specified Claude batch ID from the Claude API.

Usage

```
check_claude_batch(
  .llms = NULL,
  .batch_id = NULL,
  .api_url = "https://api.anthropic.com/",
  .dry_run = FALSE,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

.llms	A list of LLMMessages objects
.batch_id	A manually set batchid
.api_url	Character; base URL of the Claude API (default: "https://api.anthropic.com/").
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform request
.timeout	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing

`check_groq_batch` *Check Batch Processing Status for Groq API*

Description

This function retrieves the processing status and other details of a specified Groq batch.

Usage

```
check_groq_batch(  
  .llms = NULL,  
  .batch_id = NULL,  
  .api_url = "https://api.groq.com/",  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessages objects with a batch_id attribute.
.batch_id	A character string with the batch ID to check.
.api_url	Character; base URL of the Groq API (default: "https://api.groq.com/").
.dry_run	Logical; if TRUE, returns the prepared request object without executing (default: FALSE).
.max_tries	Maximum retries to perform request.
.timeout	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

check_mistral_batch *Check Batch Processing Status for Mistral Batch API*

Description

This function retrieves the processing status and other details of a specified Mistral batch ID from the Mistral Batch API.

Usage

```
check_mistral_batch(  
  .llms = NULL,  
  .batch_id = NULL,  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessage objects.
.batch_id	A manually set batch ID.
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform the request (default: 3).
.timeout	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

check_openai_batch

Check Batch Processing Status for OpenAI Batch API

Description

This function retrieves the processing status and other details of a specified OpenAI batch ID from the OpenAI Batch API.

Usage

```
check_openai_batch(
  .llms = NULL,
  .batch_id = NULL,
  .dry_run = FALSE,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

.llms	A list of LLMMessage objects.
.batch_id	A manually set batch ID.
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform the request (default: 3).
.timeout	Integer specifying the request timeout in seconds (default: 60).

Value

A tibble with information about the status of batch processing.

claude*Provider Function for Claude models on the Anthropic API*

Description

The `claude()` function acts as an interface for interacting with the Anthropic API through main `tidy1lm` verbs such as `chat()`, `embed()`, and `send_batch()`. It dynamically routes requests to Claude-specific functions like `claude_chat()` and `send_claude_batch()` based on the context of the call.

Usage

```
claude(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate OpenAI-specific function, such as model configuration, input text, or API-specific options.
<code>.called_from</code>	An internal argument that specifies which action (e.g., <code>chat</code> , <code>send_batch</code>) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`, or a matrix for `embed()`).

claude_chat*Interact with Claude AI models via the Anthropic API*

Description

Interact with Claude AI models via the Anthropic API

Usage

```
claude_chat(  
  .llm,  
  .model = "claude-3-7-sonnet-20250219",  
  .max_tokens = 2048,  
  .temperature = NULL,  
  .top_k = NULL,  
  .top_p = NULL,  
  .metadata = NULL,  
  .stop_sequences = NULL,
```

```

.tools = NULL,
.json_schema = NULL,
.api_url = "https://api.anthropic.com/",
.verbose = FALSE,
.max_tries = 3,
.timeout = 60,
.stream = FALSE,
.dry_run = FALSE,
.thinking = FALSE,
.thinking_budget = 1024
)

```

Arguments

.llm	An LLMMessages object containing the conversation history and system prompt.
.model	Character string specifying the Claude model version (default: "claude-3-5-sonnet-20241022").
.max_tokens	Integer specifying the maximum number of tokens in the response (default: 1024).
.temperature	Numeric between 0 and 1 controlling response randomness.
.top_k	Integer controlling diversity by limiting the top K tokens.
.top_p	Numeric between 0 and 1 for nucleus sampling.
.metadata	List of additional metadata to include with the request.
.stop_sequences	Character vector of sequences that will halt response generation.
.tools	List of additional tools or functions the model can use.
.json_schema	A schema to enforce an output structure
.api_url	Base URL for the Anthropic API (default: "https://api.anthropic.com/").
.verbose	Logical; if TRUE, displays additional information about the API call (default: FALSE).
.max_tries	Maximum retries to perform request
.timeout	Integer specifying the request timeout in seconds (default: 60).
.stream	Logical; if TRUE, streams the response piece by piece (default: FALSE).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.thinking	Logical; if TRUE, enables Claude's thinking mode for complex reasoning tasks (default: FALSE).
.thinking_budget	Integer specifying the maximum tokens Claude can spend on thinking (default: 1024). Must be at least 1024.

Value

A new LLMMessages object containing the original messages plus Claude's response.

Examples

```
## Not run:  
# Basic usage  
msg <- llm_message("What is R programming?")  
result <- claude_chat(msg)  
  
# With custom parameters  
result2 <- claude_chat(msg,  
                         .temperature = 0.7,  
                         .max_tokens = 1000)  
  
## End(Not run)
```

claude_list_models *List Available Models from the Anthropic Claude API*

Description

List Available Models from the Anthropic Claude API

Usage

```
claude_list_models(  
  .api_url = "https://api.anthropic.com",  
  .timeout = 60,  
  .max_tries = 3,  
  .dry_run = FALSE,  
  .verbose = FALSE  
)
```

Arguments

.api_url	Base URL for the API (default: "https://api.anthropic.com").
.timeout	Request timeout in seconds (default: 60).
.max_tries	Maximum number of retries for the API request (default: 3).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it.
.verbose	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include type,id,display_name, and created_at), or NULL if no models are found.

deepseek

*Deepseek Provider Function***Description**

The `deepseek()` function acts as a provider interface for interacting with the Deepseek API through `tidyLLM`'s `chat()` verb. It dynamically routes requests to `deepseek`-specific function. At the moment this is only `deepseek_chat()`

Usage

```
deepseek(..., .called_from = NULL)
```

Arguments

<code>...</code>	Parameters to be passed to the appropriate Deepseek-specific function, such as model configuration, input text, or API-specific options.
<code>.called_from</code>	An internal argument specifying which action (e.g., <code>chat</code> , <code>embed</code>) the function is invoked from. This argument is automatically managed by the <code>tidyLLM</code> verbs and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`).

deepseek_chat

*Send LLM Messages to the DeepSeek Chat API***Description**

This function sends a message history to the DeepSeek Chat API and returns the assistant's reply. Currently tool calls cause problems on the DeepSeek API

Usage

```
deepseek_chat(
  .llm,
  .model = "deepseek-chat",
  .max_tokens = 2048,
  .temperature = NULL,
  .top_p = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .stop = NULL,
```

```

    .stream = FALSE,
    .logprobs = NULL,
    .top_logprobs = NULL,
    .tools = NULL,
    .tool_choice = NULL,
    .api_url = "https://api.deepseek.com/",
    .timeout = 60,
    .verbose = FALSE,
    .dry_run = FALSE,
    .max_tries = 3
)

```

Arguments

.llm	An LLMMessages object containing the conversation history.
.model	The identifier of the model to use (default: "deepseek-chat").
.max_tokens	The maximum number of tokens that can be generated in the response (default: 2048).
.temperature	Controls the randomness in the model's response. Values between 0 and 2 are allowed (optional).
.top_p	Nucleus sampling parameter that controls the proportion of probability mass considered (optional).
.frequency_penalty	Number between -2.0 and 2.0. Penalizes repeated tokens to reduce repetition (optional).
.presence_penalty	Number between -2.0 and 2.0. Encourages new topics by penalizing tokens that have appeared so far (optional).
.stop	One or more sequences where the API will stop generating further tokens (optional).
.stream	Logical; if TRUE, streams the response piece by piece (default: FALSE).
.logprobs	If TRUE, returns log probabilities of each output token (default: FALSE).
.top_logprobs	Number between 0 and 5 specifying the number of top log probabilities to return (optional).
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.tool_choice	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required" (optional).
.api_url	Base URL for the DeepSeek API (default: "https://api.deepseek.com/").
.timeout	Request timeout in seconds (default: 60).
.verbose	If TRUE, displays additional information after the API call (default: FALSE).
.dry_run	If TRUE, returns the constructed request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform the request (default: 3).

Value

A new LLMMessages object containing the original messages plus the assistant's response.

`df_llm_message`

Convert a Data Frame to an LLMMessages Object

Description

This function converts a data frame into an LLMMessages object representing a conversation history. The data frame must have specific columns (`role` and `content`), with each row representing a message.

Usage

```
df_llm_message(.df)
```

Arguments

`.df` A data frame with at least two rows and columns `role` and `content`. The `role` column should contain "user", "assistant", or "system". The `content` column should contain the corresponding message text.

Value

An LLMMessages object representing the structured conversation.

See Also

[llm_message\(\)](#)

Other Message Creation Utilities: [llm_message\(\)](#)

`embed`

Generate text embeddings

Description

The `embed()` function allows you to embed a text via a specified provider. It routes the input to the appropriate provider-specific embedding function.

Usage

```
embed(  
  .input,  
  .provider = getOption("tidyllm_embed_default"),  
  .model = NULL,  
  .truncate = NULL,  
  .timeout = NULL,  
  .dry_run = NULL,  
  .max_tries = NULL  
)
```

Arguments

.input	A character vector of texts v, a list of texts and image objects, or an <code>LLMMessage</code> object
.provider	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>ollama()</code> , etc. You can also set a default provider function via the <code>tidyllm_embed_default</code> option.
.model	The embedding model to use
.truncate	Whether to truncate inputs to fit the model's context length
.timeout	Timeout for the API request in seconds
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retry attempts for requests

Value

A tibble with two columns: `input` and `embeddings`. The `input` column contains the texts sent to embed, and the `embeddings` column is a list column where each row contains an embedding vector of the sent input.

Examples

```
## Not run:  
c("What is the meaning of life, the universe and everything?",  
  "How much wood would a woodchuck chuck?",  
  "How does the brain work?") |>  
embed(gemini)  
  
## End(Not run)
```

fetch_azure_openai_batch

Fetch Results for an Azure OpenAI Batch

Description

This function retrieves the results of a completed Azure OpenAI batch and updates the provided list of LLMMessages objects with the responses. It aligns each response with the original request using the custom_ids generated in send_azure_openai_batch().

Usage

```
fetch_azure_openai_batch(  
  .llms,  
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),  
  .batch_id = NULL,  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

- .llms A list of LLMMessages objects that were part of the batch.
- .endpoint_url Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
- .batch_id Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the batch_id attribute from .llms.
- .dry_run Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
- .max_tries Integer; maximum number of retries if the request fails (default: 3).
- .timeout Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessages objects, each with the assistant's response added if successful.

fetch_batch	<i>Fetch Results from a Batch API</i>
-------------	---------------------------------------

Description

This function retrieves the results of a completed batch and updates the provided list of `LLMMessage` objects with the responses. It aligns each response with the original request using the `custom_ids` generated in `send_batch()`.

Usage

```
fetch_batch(  
  .llms,  
  .provider = getOption("tidyllm_fbatch_default"),  
  .dry_run = NULL,  
  .max_tries = NULL,  
  .timeout = NULL  
)
```

Arguments

.llms	A list of <code>LLMMessage</code> objects containing conversation histories.
.provider	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllm_fbatch_default</code> option.
.dry_run	Logical; if TRUE, returns the constructed request without executing it
.max_tries	Integer; maximum number of retries if the request fails
.timeout	Integer; request timeout in seconds

Details

The function routes the input to the appropriate provider-specific batch API function.

Value

A list of updated `LLMMessage` objects, each with the assistant's response added if successful.

fetch_claude_batch *Fetch Results for a Claude Batch*

Description

This function retrieves the results of a completed Claude batch and updates the provided list of LLMMessages objects with the responses. It aligns each response with the original request using the custom_ids generated in send_claude_batch().

Usage

```
fetch_claude_batch(  
  .llms,  
  .batch_id = NULL,  
  .api_url = "https://api.anthropic.com/",  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessages objects that were part of the batch. The list should have names (custom IDs) set by send_claude_batch() to ensure correct alignment.
.batch_id	Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the batch_id attribute from .llms.
.api_url	Character; the base URL for the Claude API (default: "https://api.anthropic.com/").
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessages objects, each with the assistant's response added if successful.

fetch_groq_batch *Fetch Results for a Groq Batch*

Description

This function retrieves the results of a completed Groq batch and updates the provided list of LLMMessages objects with the responses.

Usage

```
fetch_groq_batch(  
    .llms,  
    .batch_id = NULL,  
    .api_url = "https://api.groq.com/",  
    .dry_run = FALSE,  
    .max_tries = 3,  
    .timeout = 60  
)
```

Arguments

.llms	A list of LLMMessages objects that were part of the batch.
.batch_id	Character; the unique identifier for the batch.
.api_url	Character; the base URL for the Groq API (default: "https://api.groq.com/").
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessages objects, each with the assistant's response added if successful.

fetch_mistral_batch *Fetch Results for an Mistral Batch*

Description

This function retrieves the results of a completed Mistral batch and updates the provided list of LLMMessages objects with the responses. It aligns each response with the original request using the custom_ids generated in send_mistral_batch().

Usage

```
fetch_mistral_batch(
    .llms,
    .batch_id = NULL,
    .dry_run = FALSE,
    .max_tries = 3,
    .timeout = 60
)
```

Arguments

.llms	A list of LLMMessages objects that were part of the batch.
.batch_id	Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the <code>batch_id</code> attribute from <code>.llms</code> .
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessages objects, each with the assistant's response added if successful.

fetch_openai_batch	<i>Fetch Results for an OpenAI Batch</i>
--------------------	--

Description

This function retrieves the results of a completed OpenAI batch and updates the provided list of LLMMessages objects with the responses. It aligns each response with the original request using the `custom_ids` generated in `send_openai_batch()`.

Usage

```
fetch_openai_batch(
    .llms,
    .batch_id = NULL,
    .dry_run = FALSE,
    .max_tries = 3,
    .timeout = 60
)
```

Arguments

.llms	A list of LLMMessages objects that were part of the batch.
.batch_id	Character; the unique identifier for the batch. By default this is NULL and the function will attempt to use the batch_id attribute from .llms.
.dry_run	Logical; if TRUE, returns the constructed request without executing it (default: FALSE).
.max_tries	Integer; maximum number of retries if the request fails (default: 3).
.timeout	Integer; request timeout in seconds (default: 60).

Value

A list of updated LLMMessages objects, each with the assistant's response added if successful.

field_chr

*Define Field Descriptors for JSON Schema***Description**

These functions create field descriptors used in tidyllm_schema() or field_object() to define JSON schema fields. They support character, factor, numeric, and logical types.

Usage

```
field_chr(.description = character(0), .vector = FALSE)

field_fct(.description = character(0), .levels, .vector = FALSE)

field_dbl(.description = character(0), .vector = FALSE)

field_lgl(.description = character(0), .vector = FALSE)
```

Arguments

.description	A character string describing the field (optional).
.vector	A logical value indicating if the field is a vector (default: FALSE).
.levels	A character vector specifying allowable values (for field_fct() only).

Value

An S7 tidyllm_field object representing the field descriptor.

Examples

```
field_chr("A common street name")
field_fct("State abbreviation", .levels = c("CA", "TX", "Other"))
field_dbl("House number")
field_lgl("Is residential")
field_dbl("A list of apartment numbers at the address", .vector=TRUE )
```

<code>field_object</code>	<i>Define a nested object field</i>
---------------------------	-------------------------------------

Description

Define a nested object field

Usage

```
field_object(.description = character(0), ..., .vector = FALSE)
```

Arguments

- .description A character string describing the field (optional).
- ... Named fields to include in the object definition (required).
- .vector A logical value indicating if the field is a list of objects (default: FALSE).

Value

An S7 `tidy1lm_field` object of type "object" containing nested fields.

Examples

```
# Define an address object with nested fields
address <- field_object("A mailing address",
  street = field_chr("Street name"),
  city = field_chr("City name"),
  zipcode = field_chr("Postal code")
)

# Create a vector of objects
addresses <- field_object("List of addresses",
  street = field_chr("Street name"),
  city = field_chr("City name"),
  .vector = TRUE
)
```

<code>gemini</code>	<i>Google Gemini Provider Function</i>
---------------------	--

Description

The `gemini()` function acts as a provider interface for interacting with the Google Gemini API through `tidy1lm`'s main verbs such as `chat()` and `embed()`. It dynamically routes requests to Gemini-specific functions like `gemini_chat()` and `gemini_embedding()` based on the context of the call.

Usage

```
gemini(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate Gemini-specific function, such as model configuration, input text, or API-specific options.
.called_from	An internal argument specifying which action (e.g., chat, embed) the function is invoked from. This argument is automatically managed by the <code>tidyllm</code> verbs and should not be modified by the user.

Details

Some functions, such as `gemini_upload_file()` and `gemini_delete_file()`, are specific to Gemini and do not have general verb counterparts.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`).

gemini_chat	<i>Send LLMMessage to Gemini API</i>
-------------	--------------------------------------

Description

Send LLMMessage to Gemini API

Usage

```
gemini_chat(  
  .llm,  
  .model = "gemini-2.0-flash",  
  .fileid = NULL,  
  .temperature = NULL,  
  .max_output_tokens = NULL,  
  .top_p = NULL,  
  .top_k = NULL,  
  .grounding_threshold = NULL,  
  .presence_penalty = NULL,  
  .frequency_penalty = NULL,  
  .stop_sequences = NULL,  
  .safety_settings = NULL,  
  .json_schema = NULL,  
  .tools = NULL,  
  .timeout = 120,  
  .dry_run = FALSE,
```

```

    .max_tries = 3,
    .verbose = FALSE,
    .stream = FALSE
)

```

Arguments

.llm	An existing LLMMessages object or an initial text prompt.
.model	The model identifier (default: "gemini-1.5-flash").
.fileid	Optional vector of file IDs uploaded via <code>gemini_upload_file()</code> (default: NULL).
.temperature	Controls randomness in generation (default: NULL, range: 0.0-2.0).
.max_output_tokens	Maximum tokens in the response (default: NULL).
.top_p	Controls nucleus sampling (default: NULL, range: 0.0-1.0).
.top_k	Controls diversity in token selection (default: NULL, range: 0 or more).
.grounding_threshold	A grounding threshold between 0 and 1. With lower grounding thresholds Gemini will use Google to search for relevant information before answering. (default: NULL).
.presence_penalty	Penalizes new tokens (default: NULL, range: -2.0 to 2.0).
.frequency_penalty	Penalizes frequent tokens (default: NULL, range: -2.0 to 2.0).
.stop_sequences	Optional character sequences to stop generation (default: NULL, up to 5).
.safety_settings	A list of safety settings (default: NULL).
.json_schema	A schema to enforce an output structure
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.timeout	When should our connection time out (default: 120 seconds).
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retries to perform request (default: 3).
.verbose	Should additional information be shown after the API call.
.stream	Should the response be streamed (default: FALSE).

Value

A new LLMMessages object containing the original messages plus the assistant's response.

gemini_delete_file *Delete a File from Gemini API*

Description

Deletes a specific file from the Gemini API using its file ID.

Usage

```
gemini_delete_file(.file_name)
```

Arguments

.file_name The file ID (e.g., "files/abc-123") to delete.

Value

Invisibly returns NULL. Prints a confirmation message upon successful deletion.

gemini_embedding *Generate Embeddings Using the Google Gemini API*

Description

Generate Embeddings Using the Google Gemini API

Usage

```
gemini_embedding(  
  .input,  
  .model = "text-embedding-004",  
  .truncate = TRUE,  
  .timeout = 120,  
  .dry_run = FALSE,  
  .max_tries = 3  
)
```

Arguments

.input	A character vector of texts to embed or an LLMMessage object
.model	The embedding model identifier (default: "text-embedding-3-small").
.truncate	Whether to truncate inputs to fit the model's context length (default: TRUE).
.timeout	Timeout for the API request in seconds (default: 120).
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retry attempts for requests (default: 3).

Value

A matrix where each column corresponds to the embedding of a message in the message history.

`gemini_file_metadata` *Retrieve Metadata for a File from Gemini API*

Description

Retrieves metadata for a specific file uploaded to the Gemini API.

Usage

```
gemini_file_metadata(.file_name)
```

Arguments

.file_name The file ID (e.g., "files/abc-123") to retrieve metadata for.

Value

A tibble containing metadata fields such as name, display name, MIME type, size, and URI.

`gemini_list_files` *List Files in Gemini API*

Description

Lists metadata for files uploaded to the Gemini API, supporting pagination.

Usage

```
gemini_list_files(.page_size = 10, .page_token = NULL)
```

Arguments

.page_size The maximum number of files to return per page (default: 10, maximum: 100).
.page_token A token for fetching the next page of results (default: NULL).

Value

A tibble containing metadata for each file, including fields such as name, display name, MIME type, and URI.

gemini_upload_file *Upload a File to Gemini API*

Description

Uploads a file to the Gemini API and returns its metadata as a tibble.

Usage

```
gemini_upload_file(.file_path)
```

Arguments

.file_path The local file path of the file to upload.

Value

A tibble containing metadata about the uploaded file, including its name, URI, and MIME type.

get_logprobs *Retrieve Log Probabilities from Assistant Replies*

Description

Extracts token log probabilities from assistant replies within an `LLMMessage` object. Each row represents a token with its log probability and top alternative tokens.

Usage

```
get_logprobs(.llm, .index = NULL)
```

Arguments

.llm An `LLMMessage` object containing the message history.
.index A positive integer specifying which assistant reply's log probabilities to extract.
If `NULL` (default), log probabilities for all replies are returned.

Details

An empty tibble is output if no logprobs were requested. Currently only works with `openai_chat()`

Columns include:

- `reply_index`: The index of the assistant reply in the message history.
- `token`: The generated token.
- `logprob`: The log probability of the generated token.
- `bytes`: The byte-level encoding of the token.
- `top_logprobs`: A list column containing the top alternative tokens with their log probabilities.

Value

A tibble containing log probabilities for the specified assistant reply or all replies.

See Also

[get_metadata\(\)](#)

`get_metadata`

Retrieve Metadata from Assistant Replies

Description

Retrieves metadata from assistant replies within an `LLMMessage` object. It returns the metadata as a tibble.

Usage

```
get_metadata(.llm, .index = NULL)
```

```
last_metadata(.llm)
```

Arguments

- | | |
|--------|--|
| .llm | An <code>LLMMessage</code> object containing the message history. |
| .index | A positive integer specifying which assistant reply's metadata to extract. If <code>NULL</code> (default), metadata for all replies is returned. |

Details

Metadata columns may include:

- `model`: The model used for generating the reply.
- `timestamp`: The time when the reply was generated.
- `prompt_tokens`: The number of tokens in the input prompt.
- `completion_tokens`: The number of tokens in the assistant's reply.
- `total_tokens`: The total number of tokens (prompt + completion).
- `api_specific`: A list column with API-specific metadata.

For convenience, [last_metadata\(\)](#) is provided to retrieve the metadata for the last message.

Value

A tibble containing metadata for the specified assistant reply or all replies.

See Also

[last_metadata\(\)](#)

get_reply	<i>Retrieve Assistant Reply as Text</i>
-----------	---

Description

Extracts the plain text content of the assistant's reply from an LLMMessages object. Use [get_reply_data\(\)](#) for structured replies in JSON format.

Usage

```
get_reply(.llm, .index = NULL)
```

```
last_reply(.llm)
```

Arguments

.llm	An LLMMessages object containing the message history.
.index	A positive integer indicating the index of the assistant reply to retrieve. Defaults to NULL, which retrieves the last reply.

Details

This function is the core utility for retrieving assistant replies by index. For convenience, [last_reply\(\)](#) is provided as a wrapper to retrieve the latest assistant reply.

Value

Returns a character string containing the assistant's reply, or NA_character_ if no reply exists.

See Also

[get_reply_data\(\)](#), [last_reply\(\)](#)

get_reply_data	<i>Retrieve Assistant Reply as Structured Data</i>
----------------	--

Description

Parses the assistant's reply as JSON and returns the corresponding structured data. If the reply is not marked as JSON, attempts to extract and parse JSON content from the text.

Usage

```
get_reply_data(.llm, .index = NULL)
```

```
last_reply_data(.llm)
```

Arguments

- | | |
|---------------------|---|
| <code>.llm</code> | An LLMMessages object containing the message history. |
| <code>.index</code> | A positive integer indicating the index of the assistant reply to retrieve. Defaults to NULL, which retrieves the last reply. |

Details

For convenience, [last_reply_data\(\)](#) is provided as a wrapper to retrieve the latest assistant reply's data.

Value

Returns the parsed data from the assistant's reply, or NULL if parsing fails.

See Also

[get_reply\(\)](#), [last_reply_data\(\)](#)

`get_user_message` *Retrieve a User Message by Index*

Description

Extracts the content of a user's message from an LLMMessages object at a specific index.

Usage

```
get_user_message(.llm, .index = NULL)  
last_user_message(.llm)
```

Arguments

- | | |
|---------------------|---|
| <code>.llm</code> | An LLMMessages object. |
| <code>.index</code> | A positive integer indicating which user message to retrieve. Defaults to NULL, which retrieves the last message. |

Details

For convenience, [last_user_message\(\)](#) is provided as a wrapper to retrieve the latest user message without specifying an index.

Value

Returns the content of the user's message at the specified index. If no messages are found, returns NA_character_.

See Also

[last_user_message\(\)](#)

groq

Groq API Provider Function

Description

The `groq()` function acts as an interface for interacting with the Groq API through `tidyllm`'s main verbs. Currently, Groq only supports `groq_chat()` for chat-based interactions and `groq_transcribe()` for transcription tasks.

Usage

```
groq(..., .called_from = NULL)
```

Arguments

- | | |
|--------------|--|
| ... | Parameters to be passed to the Groq-specific function, such as model configuration, input text, or API-specific options. |
| .called_from | An internal argument that specifies which action (e.g., <code>chat</code>) the function is being invoked from. This argument is automatically managed and should not be modified by the user. |

Details

Since `groq_transcribe()` is unique to Groq and does not have a general verb counterpart, `groq()` currently routes messages only to `groq_chat()` when used with verbs like `chat()`.

Value

The result of the requested action, depending on the specific function invoked (currently, only an updated `LLMMessage` object for `groq_chat()`).

groq_chat

Send LLM Messages to the Groq Chat API

Description

This function sends a message history to the Groq Chat API and returns the assistant's reply.

Usage

```
groq_chat(
  .llm,
  .model = "deepseek-r1-distill-llama-70b",
  .max_tokens = 1024,
  .temperature = NULL,
  .top_p = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .stop = NULL,
  .seed = NULL,
  .tools = NULL,
  .tool_choice = NULL,
  .api_url = "https://api.groq.com/",
  .json = FALSE,
  .timeout = 60,
  .verbose = FALSE,
  .stream = FALSE,
  .dry_run = FALSE,
  .max_tries = 3
)
```

Arguments

.llm	An LLMMessages object containing the conversation history.
.model	The identifier of the model to use (default: "llama-3.2-11b-vision-preview").
.max_tokens	The maximum number of tokens that can be generated in the response (default: 1024).
.temperature	Controls the randomness in the model's response. Values between 0 and 2 are allowed, where higher values increase randomness (optional).
.top_p	Nucleus sampling parameter that controls the proportion of probability mass considered. Values between 0 and 1 are allowed (optional).
.frequency_penalty	Number between -2.0 and 2.0. Positive values penalize repeated tokens, reducing likelihood of repetition (optional).
.presence_penalty	Number between -2.0 and 2.0. Positive values encourage new topics by penalizing tokens that have appeared so far (optional).
.stop	One or more sequences where the API will stop generating further tokens. Can be a string or a list of strings (optional).
.seed	An integer for deterministic sampling. If specified, attempts to return the same result for repeated requests with identical parameters (optional).
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls (optional).
.tool_choice	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required" (optional).

.api_url	Base URL for the Groq API (default: "https://api.groq.com/").
.json	Whether the response should be structured as JSON (default: FALSE).
.timeout	Request timeout in seconds (default: 60).
.verbose	If TRUE, displays additional information after the API call, including rate limit details (default: FALSE).
.stream	Logical; if TRUE, streams the response piece by piece (default: FALSE).
.dry_run	If TRUE, performs a dry run and returns the constructed request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform request

Value

A new LLMMessages object containing the original messages plus the assistant's response.

Examples

```
## Not run:
# Basic usage
msg <- llm_message("What is Groq?")
result <- groq_chat(msg)

# With custom parameters
result2 <- groq_chat(msg,
                      .model = "llama-3.2-vision",
                      .temperature = 0.5,
                      .max_tokens = 512)

## End(Not run)
```

groq_list_models

List Available Models from the Groq API

Description

List Available Models from the Groq API

Usage

```
groq_list_models(
  .api_url = "https://api.groq.com",
  .timeout = 60,
  .max_tries = 3,
  .dry_run = FALSE,
  .verbose = FALSE
)
```

Arguments

<code>.api_url</code>	Base URL for the API (default: "https://api.groq.com").
<code>.timeout</code>	Request timeout in seconds (default: 60).
<code>.max_tries</code>	Maximum number of retries for the API request (default: 3).
<code>.dry_run</code>	Logical; if TRUE, returns the prepared request object without executing it.
<code>.verbose</code>	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include `id`, `created`, `owned_by`, and `context_window`), or NULL if no models are found.

`groq_transcribe`*Transcribe an Audio File Using Groq transcription API***Description**

This function reads an audio file and sends it to the Groq transcription API for transcription.

Usage

```
groq_transcribe(
  .audio_file,
  .model = "whisper-large-v3",
  .language = NULL,
  .prompt = NULL,
  .temperature = 0,
  .api_url = "https://api.groq.com/openai/v1/audio/transcriptions",
  .dry_run = FALSE,
  .verbose = FALSE,
  .max_tries = 3
)
```

Arguments

<code>.audio_file</code>	The path to the audio file (required). Supported formats include flac, mp3, mp4, mpeg, mpg, m4a, ogg, wav, or webm.
<code>.model</code>	The model to use for transcription (default: "whisper-large-v3").
<code>.language</code>	The language of the input audio, in ISO-639-1 format (optional).
<code>.prompt</code>	A prompt to guide the transcription style. It should match the audio language (optional).
<code>.temperature</code>	Sampling temperature, between 0 and 1, with higher values producing more randomness (default: 0).
<code>.api_url</code>	Base URL for the API (default: "https://api.groq.com/openai/v1/audio/transcriptions").

.dry_run	Logical; if TRUE, performs a dry run and returns the request object without making the API call (default: FALSE).
.verbose	Logical; if TRUE, rate limiting info is displayed after the API request (default: FALSE).
.max_tries	Maximum retries to perform request

Value

A character vector containing the transcription.

Examples

```
## Not run:  
# Basic usage  
groq_transcribe(.audio_file = "example.mp3")  
  
## End(Not run)
```

img	<i>Create an Image Object</i>
-----	-------------------------------

Description

This function reads an image file from disk, encodes it in base64, and returns a `tidyllm_image` object that can be used in multimodal embedding requests.

Usage

```
img(.path)
```

Arguments

.path	The path to the image file on disk.
-------	-------------------------------------

Value

An `tidyllm_image`, containing:

- `imagepath`: The original file path
- `imagename`: The basename of the image
- `imagebase64`: a "data:image/...;base64,..." string

list_azure_openai_batches*List Azure OpenAI Batch Requests***Description**

Retrieves batch request details from the Azure OpenAI Batch API.

Usage

```
list_azure_openai_batches(
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),
  .limit = 20,
  .max_tries = 3,
  .timeout = 60
)
```

Arguments

.endpoint_url	Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
.limit	Maximum number of batches to retrieve (default: 20).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).

Value

A tibble with batch details: batch ID, status, creation time, expiration time, and request counts (total, completed, failed).

list_batches*List all Batch Requests on a Batch API***Description**

List all Batch Requests on a Batch API

Usage

```
list_batches(.provider = getOption("tidyllum_lbatch_default"))
```

Arguments

.provider	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllum_lbatch_default</code> option.
-----------	--

Value

A tibble with information about the status of batch processing.

list_claude_batches *List Claude Batch Requests*

Description

Retrieves batch request details from the Claude API.

Usage

```
list_claude_batches(  
  .api_url = "https://api.anthropic.com/",  
  .limit = 20,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

.api_url	Base URL for the Claude API (default: "https://api.anthropic.com/").
.limit	Maximum number of batches to retrieve (default: 20).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).

Value

A tibble with batch details: batch ID, status, creation time, expiration time, and request counts (succeeded, errored, expired, canceled).

list_groq_batches *List Groq Batch Requests*

Description

Retrieves batch request details from the Groq API.

Usage

```
list_groq_batches(  
  .api_url = "https://api.groq.com/",  
  .limit = 20,  
  .max_tries = 3,  
  .timeout = 60  
)
```

Arguments

- .api_url Base URL for the Groq API (default: "https://api.groq.com/").
- .limit Maximum number of batches to retrieve (default: 20).
- .max_tries Maximum retry attempts for requests (default: 3).
- .timeout Request timeout in seconds (default: 60).

Value

A tibble with batch details including batch ID, status, creation time, and request counts.

list_mistral_batches *List Mistral Batch Requests***Description**

Retrieves batch request details from the OpenAI Batch API.

Usage

```
list_mistral_batches(
  .limit = 100,
  .max_tries = 3,
  .timeout = 60,
  .status = NULL,
  .created_after = NULL
)
```

Arguments

- .limit Maximum number of batches to retrieve (default: 20).
- .max_tries Maximum retry attempts for requests (default: 3).
- .timeout Request timeout in seconds (default: 60).
- .status Filter by status. (default: NULL)
- .created_after created after a string specifying a date-time (default: NULL)

Value

A tibble with batch details for all batches fitting the request

list_models	<i>List Available Models for a Provider</i>
-------------	---

Description

The `list_models()` function retrieves available models from the specified provider.

Usage

```
list_models(.provider = getOption("tidyllum_lmodels_default"), ...)
```

Arguments

- | | |
|-----------|--|
| .provider | A function or function call specifying the provider and any additional parameters. You can also set a default provider via the <code>tidyllum_lmodels_default</code> option. |
| ... | Additional arguments to be passed to the provider-specific <code>list_models</code> function. |

Value

A tibble containing model information.

list_openai_batches	<i>List OpenAI Batch Requests</i>
---------------------	-----------------------------------

Description

Retrieves batch request details from the OpenAI Batch API.

Usage

```
list_openai_batches(.limit = 20, .max_tries = 3, .timeout = 60)
```

Arguments

- | | |
|------------|--|
| .limit | Maximum number of batches to retrieve (default: 20). |
| .max_tries | Maximum retry attempts for requests (default: 3). |
| .timeout | Request timeout in seconds (default: 60). |

Value

A tibble with batch details: batch ID, status, creation time, expiration time, and request counts (total, completed, failed).

LLMMessage*Large Language Model Message Class*

Description

`LLMMessage` is an S7 class for managing a conversation history intended for use with large language models (LLMs). Please use `llm_message()` to create or modify `LLMMessage` objects.

Usage

```
LLMMessage(message_history = list(), system_prompt = character(0))
```

Arguments**message_history**

A list containing messages. Each message is a named list with keys like `role`, `content`, `media`, etc.

system_prompt A character string representing the default system prompt used for the conversation.**Details**

The `LLMMessage` class includes the following features:

- Stores message history in a structured format.
- Supports attaching media and metadata to messages.
- Provides generics like `add_message()`, `has_image()`, and `remove_message()` for interaction.
- Enables API-specific formatting through the `to_api_format()` generic.
- `message_history`: A list containing messages. Each message is a named list with keys like `role`, `content`, `media`, etc.
- `system_prompt`: A character string representing the default system prompt used for the conversation.

llm_message*Create or Update Large Language Model Message Object*

Description

This function creates a new `LLMMessage` object or updates an existing one. It supports adding text prompts and various media types, such as images, PDFs, text files, or plots.

Usage

```
llm_message(  
  .llm = NULL,  
  .prompt = NULL,  
  .role = "user",  
  .system_prompt = "You are a helpful assistant",  
  .imagefile = NULL,  
  .pdf = NULL,  
  .textfile = NULL,  
  .capture_plot = FALSE,  
  .f = NULL  
)
```

Arguments

.llm	An existing LLMMMessage object or an initial text prompt.
.prompt	Text prompt to add to the message history.
.role	The role of the message sender, typically "user" or "assistant".
.system_prompt	Default system prompt if a new LLMMMessage needs to be created.
.imagefile	Path to an image file to be attached (optional).
.pdf	Path to a PDF file to be attached (optional). Can be a character vector of length one (file path), or a list with <code>filename</code> , <code>start_page</code> , and <code>end_page</code> .
.textfile	Path to a text file to be read and attached (optional).
.capture_plot	Boolean to indicate whether a plot should be captured and attached as an image (optional).
.f	An R function or an object coercible to a function via <code>rlang::as_function</code> , whose output should be captured and attached (optional).

Value

Returns an updated or new LLMMMessage object.

Other Message Creation Utilities: [df_llm_message\(\)](#)

mistral*Mistral Provider Function*

Description

The `mistral()` function acts as an interface for interacting with the Mistral API through main `tidyllm` verbs such as `chat()` and `embed()`. It dynamically routes requests to Mistral-specific functions like `mistral_chat()` and `mistral_embedding()` based on the context of the call.

Usage

```
mistral(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate Mistral-specific function, such as model configuration, input text, or API-specific options.
<code>.called_from</code>	An internal argument that specifies which action (e.g., <code>chat</code> , <code>embed</code> , <code>send_batch</code>) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated `LLMMessage` object for `chat()`, or a matrix for `embed()`).

mistral_chat*Send LLMMessage to Mistral API*

Description

Send `LLMMessage` to Mistral API

Usage

```
mistral_chat(
  .llm,
  .model = "mistral-large-latest",
  .frequency_penalty = NULL,
  .logit_bias = NULL,
  .presence_penalty = NULL,
  .seed = NULL,
  .stop = NULL,
  .stream = FALSE,
  .temperature = 0.7,
```

```

    .top_p = 1,
    .min_tokens = NULL,
    .max_tokens = NULL,
    .json_schema = NULL,
    .safe_prompt = FALSE,
    .timeout = 120,
    .max_tries = 3,
    .dry_run = FALSE,
    .verbose = FALSE,
    .tools = NULL,
    .tool_choice = NULL
)

```

Arguments

.llm	An LLMMMessage object.
.model	The model identifier to use (default: "mistral-large-latest").
.frequency_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
.logit_bias	A named list modifying the likelihood of specified tokens appearing in the completion.
.presence_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
.seed	If specified, the system will make a best effort to sample deterministically.
.stop	Up to 4 sequences where the API will stop generating further tokens.
.stream	If set to TRUE, the answer will be streamed to console as it comes (default: FALSE).
.temperature	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
.top_p	An alternative to sampling with temperature, called nucleus sampling.
.min_tokens	The minimum number of tokens to generate in the completion. Must be >= 0 (optional).
.max_tokens	An upper bound for the number of tokens that can be generated for a completion.
.json_schema	A JSON schema object provided by tidyllm schema or ellmer schemata.
.safe_prompt	Whether to inject a safety prompt before all conversations (default: FALSE).
.timeout	When should our connection time out in seconds (default: 120).
.max_tries	Maximum retries to perform request
.dry_run	If TRUE, perform a dry run and return the request object (default: FALSE).
.verbose	Should additional information be shown after the API call? (default: FALSE)
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.tool_choice	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required".

Value

Returns an updated LLMMessage object.

<code>mistral_embedding</code>	<i>Generate Embeddings Using Mistral API</i>
--------------------------------	--

Description

Generate Embeddings Using Mistral API

Usage

```
mistral_embedding(
  .input,
  .model = "mistral-embed",
  .timeout = 120,
  .max_tries = 3,
  .dry_run = FALSE
)
```

Arguments

.input	A character vector of texts to embed or an LLMMessage object
.model	The embedding model identifier (default: "mistral-embed").
.timeout	Timeout for the API request in seconds (default: 120).
.max_tries	Maximum retries to perform request
.dry_run	If TRUE, perform a dry run and return the request object.

Value

A matrix where each column corresponds to the embedding of a message in the message history.

<code>mistral_list_models</code>	<i>List Available Models from the Mistral API</i>
----------------------------------	---

Description

List Available Models from the Mistral API

Usage

```
mistral_list_models(  
  .api_url = "https://api.mistral.ai",  
  .timeout = 60,  
  .max_tries = 3,  
  .dry_run = FALSE,  
  .verbose = FALSE  
)
```

Arguments

.api_url	Base URL for the API (default: "https://api.mistral.ai").
.timeout	Request timeout in seconds (default: 60).
.max_tries	Maximum number of retries for the API request (default: 3).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it.
.verbose	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include `id` and `created`), or NULL if no models are found.

ollama*Ollama API Provider Function*

Description

The `ollama()` function acts as an interface for interacting with local AI models via the Ollama API. It integrates seamlessly with the main `tidyverse` verbs such as `chat()` and `embed()`.

Usage

```
ollama(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate Ollama-specific function, such as model configuration, input text, or API-specific options.
.called_from	An internal argument specifying the verb (e.g., <code>chat</code> , <code>embed</code>) the function is invoked from. This argument is automatically managed by <code>tidyverse</code> and should not be set by the user.

Details

Some functionalities, like `ollama_download_model()` or `ollama_list_models()` are unique to the Ollama API and do not have a general verb counterpart. These functions can be only accessed directly.

Supported Verbs:

- `chat()`: Sends a message to an Ollama model and retrieves the model's response.
- `embed()`: Generates embeddings for input texts using an Ollama model.
- `send_batch()`: Behaves different than the other `send_batch()` verbs since it immediately processes the answers

Value

The result of the requested action:

- For `chat()`: An updated `LLMMessage` object containing the model's response.
- For `embed()`: A matrix where each column corresponds to an embedding.

ollama_chat

Interact with local AI models via the Ollama API

Description

Interact with local AI models via the Ollama API

Usage

```
ollama_chat(  
  .llm,  
  .model = "gemma2",  
  .stream = FALSE,  
  .seed = NULL,  
  .json_schema = NULL,  
  .temperature = NULL,  
  .num_ctx = 2048,  
  .num_predict = NULL,  
  .top_k = NULL,  
  .top_p = NULL,  
  .min_p = NULL,  
  .mirostat = NULL,  
  .mirostat_eta = NULL,  
  .mirostat_tau = NULL,  
  .repeat_last_n = NULL,  
  .repeat_penalty = NULL,  
  .tools = NULL,  
  .tfs_z = NULL,
```

```

  .stop = NULL,
  .ollama_server = "http://localhost:11434",
  .timeout = 120,
  .keep_alive = NULL,
  .dry_run = FALSE
)

```

Arguments

.llm	An LLMMMessage object containing the conversation history and system prompt.
.model	Character string specifying the Ollama model to use (default: "gemma2")
.stream	Logical; whether to stream the response (default: FALSE)
.seed	Integer; seed for reproducible generation (default: NULL)
.json_schema	A JSON schema object as R list to enforce the output structure (default: NULL)
.temperature	Float between 0-2; controls randomness in responses (default: NULL)
.num_ctx	Integer; sets the context window size (default: 2048)
.num_predict	Integer; maximum number of tokens to predict (default: NULL)
.top_k	Integer; controls diversity by limiting top tokens considered (default: NULL)
.top_p	Float between 0-1; nucleus sampling threshold (default: NULL)
.min_p	Float between 0-1; minimum probability threshold (default: NULL)
.mirostat	Integer (0,1,2); enables Mirostat sampling algorithm (default: NULL)
.mirostat_eta	Float; Mirostat learning rate (default: NULL)
.mirostat_tau	Float; Mirostat target entropy (default: NULL)
.repeat_last_n	Integer; tokens to look back for repetition (default: NULL)
.repeat_penalty	Float; penalty for repeated tokens (default: NULL)
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.tfs_z	Float; tail free sampling parameter (default: NULL)
.stop	Character; custom stop sequence(s) (default: NULL)
.ollama_server	String; Ollama API endpoint (default: "http://localhost:11434")
.timeout	Integer; API request timeout in seconds (default: 120)
.keep_alive	Character; How long should the ollama model be kept in memory after request (default: NULL - 5 Minutes)
.dry_run	Logical; if TRUE, returns request object without execution (default: FALSE)

Details

The function provides extensive control over the generation process through various parameters:

- Temperature (0-2): Higher values increase creativity, lower values make responses more focused

- Top-k/Top-p: Control diversity of generated text
- Mirostat: Advanced sampling algorithm for maintaining consistent complexity
- Repeat penalties: Prevent repetitive text
- Context window: Control how much previous conversation is considered

Value

A new LLMMessage object containing the original messages plus the model's response

Examples

```
## Not run:
llm_message("user", "Hello, how are you?")
response <- ollama_chat(llm, .model = "gemma2", .temperature = 0.7)

# With custom parameters
response <- ollama_chat(
  llm,
  .model = "llama2",
  .temperature = 0.8,
  .top_p = 0.9,
  .num_ctx = 4096
)
## End(Not run)
```

ollama_delete_model *Delete a model from the Ollama API*

Description

This function sends a DELETE request to the Ollama API to remove a specified model.

Usage

```
ollama_delete_model(.model, .ollama_server = "http://localhost:11434")
```

Arguments

- .model The name of the model to delete.
- .ollama_server The base URL of the Ollama API (default is "http://localhost:11434").

ollama_download_model *Download a model from the Ollama API*

Description

This function sends a request to the Ollama API to download a specified model from Ollama's large online library of models.

Usage

```
ollama_download_model(.model, .ollama_server = "http://localhost:11434")
```

Arguments

.model The name of the model to download.
.ollama_server The base URL of the Ollama API (default is "http://localhost:11434").

ollama_embedding *Generate Embeddings Using Ollama API*

Description

Generate Embeddings Using Ollama API

Usage

```
ollama_embedding(  
  .input,  
  .model = "all-minilm",  
  .truncate = TRUE,  
  .ollama_server = "http://localhost:11434",  
  .timeout = 120,  
  .dry_run = FALSE  
)
```

Arguments

.input A character vector of texts to embed or an LLMMessage object
.model The embedding model identifier (default: "all-minilm").
.truncate Whether to truncate inputs to fit the model's context length (default: TRUE).
.ollama_server The URL of the Ollama server to be used (default: "http://localhost:11434").
.timeout Timeout for the API request in seconds (default: 120).
.dry_run If TRUE, perform a dry run and return the request object.

Value

A matrix where each column corresponds to the embedding of a message in the message history.

ollama_list_models	<i>Retrieve and return model information from the Ollama API</i>
--------------------	--

Description

This function connects to the Ollama API and retrieves information about available models, returning it as a tibble.

Usage

```
ollama_list_models(.ollama_server = "http://localhost:11434")
```

Arguments

.ollama_server The URL of the ollama server to be used

Value

A tibble containing model information, or NULL if no models are found.

openai	<i>OpenAI Provider Function</i>
--------	---------------------------------

Description

The openai() function acts as an interface for interacting with the OpenAI API through main tidyverse verbs such as chat(), embed(), and send_batch(). It dynamically routes requests to OpenAI-specific functions like openai_chat() and openai_embedding() based on the context of the call.

Usage

```
openai(..., .called_from = NULL)
```

Arguments

- ... Parameters to be passed to the appropriate OpenAI-specific function, such as model configuration, input text, or API-specific options.
- .called_from An internal argument that specifies which action (e.g., chat, embed, send_batch) the function is being invoked from. This argument is automatically managed and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated LLMMessages object for chat(), or a matrix for embed()).

openai_chat*Send LLM Messages to the OpenAI Chat Completions API*

Description

This function sends a message history to the OpenAI Chat Completions API and returns the assistant's reply.

Usage

```
openai_chat(  
  .llm,  
  .model = "gpt-4o",  
  .max_completion_tokens = NULL,  
  .reasoning_effort = NULL,  
  .frequency_penalty = NULL,  
  .logit_bias = NULL,  
  .presence_penalty = NULL,  
  .seed = NULL,  
  .stop = NULL,  
  .stream = FALSE,  
  .temperature = NULL,  
  .top_p = NULL,  
  .api_url = "https://api.openai.com/",  
  .timeout = 60,  
  .verbose = FALSE,  
  .json_schema = NULL,  
  .max_tries = 3,  
  .dry_run = FALSE,  
  .compatible = FALSE,  
  .api_path = "/v1/chat/completions",  
  .logprobs = NULL,  
  .top_logprobs = NULL,  
  .tools = NULL,  
  .tool_choice = NULL  
)
```

Arguments

- | | |
|--------|--|
| .llm | An LLMMessages object containing the conversation history. |
| .model | The identifier of the model to use (default: "gpt-4o"). |

.max_completion_tokens	An upper bound for the number of tokens that can be generated for a completion.
.reasoning_effort	How long should reasoning models reason (can either be "low","medium" or "high")
.frequency_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
.logit_bias	A named list modifying the likelihood of specified tokens appearing in the completion.
.presence_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
.seed	If specified, the system will make a best effort to sample deterministically.
.stop	Up to 4 sequences where the API will stop generating further tokens.
.stream	If set to TRUE, the answer will be streamed to console as it comes (default: FALSE).
.temperature	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
.top_p	An alternative to sampling with temperature, called nucleus sampling.
.api_url	Base URL for the API (default: "https://api.openai.com/").
.timeout	Request timeout in seconds (default: 60).
.verbose	Should additional information be shown after the API call (default: FALSE).
.json_schema	A JSON schema object provided by tidyllm schema or ellmer schemata.
.max_tries	Maximum retries to perform request
.dry_run	If TRUE, perform a dry run and return the request object (default: FALSE).
.compatible	If TRUE, skip API and rate-limit checks for OpenAI compatible APIs (default: FALSE).
.api_path	The path relative to the base .api_url for the API (default: "/v1/chat/completions").
.logprobs	If TRUE, get the log probabilities of each output token (default: NULL).
.top_logprobs	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
.tools	Either a single TOOL object or a list of TOOL objects representing the available functions for tool calls.
.tool_choice	A character string specifying the tool-calling behavior; valid values are "none", "auto", or "required".

Value

A new LLMMessages object containing the original messages plus the assistant's response.

openai_embedding *Generate Embeddings Using OpenAI API*

Description

Generate Embeddings Using OpenAI API

Usage

```
openai_embedding(  
  .input,  
  .model = "text-embedding-3-small",  
  .truncate = TRUE,  
  .timeout = 120,  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .verbose = FALSE  
)
```

Arguments

.input	An existing LLMMMessage object (or a character vector of texts to embed)
.model	The embedding model identifier (default: "text-embedding-3-small").
.truncate	Whether to truncate inputs to fit the model's context length (default: TRUE).
.timeout	Timeout for the API request in seconds (default: 120).
.dry_run	If TRUE, perform a dry run and return the request object.
.max_tries	Maximum retry attempts for requests (default: 3).
.verbose	Should information about current ratelimits be printed? (default: FALSE)

Value

A tibble with two columns: `input` and `embeddings`. The `input` column contains the texts sent to embed, and the `embeddings` column is a list column where each row contains an embedding vector of the sent input.

openai_list_models *List Available Models from the OpenAI API*

Description

List Available Models from the OpenAI API

Usage

```
openai_list_models(
  .api_url = "https://api.openai.com",
  .timeout = 60,
  .max_tries = 3,
  .dry_run = FALSE,
  .verbose = FALSE
)
```

Arguments

.api_url	Base URL for the API (default: "https://api.openai.com").
.timeout	Request timeout in seconds (default: 60).
.max_tries	Maximum number of retries for the API request (default: 3).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it.
.verbose	Logical; if TRUE, prints additional information about the request.

Value

A tibble containing model information (columns include id, created, and owned_by), or NULL if no models are found.

pdf_page_batch	<i>Batch Process PDF into LLM Messages</i>
----------------	--

Description

This function processes a PDF file page by page. For each page, it extracts the text and converts the page into an image. It creates a list of LLMMessages objects with the text and the image for multimodal processing. Users can specify a range of pages to process and provide a custom function to generate prompts for each page.

Usage

```
pdf_page_batch(
  .pdf,
  .general_prompt,
  .system_prompt = "You are a helpful assistant",
  .page_range = NULL,
  .prompt_fn = NULL
)
```

Arguments

- .pdf Path to the PDF file.
- .general_prompt A default prompt that is applied to each page if .prompt_fn is not provided.
- .system_prompt Optional system prompt to initialize the LLMMMessage (default is "You are a helpful assistant").
- .page_range A vector of two integers specifying the start and end pages to process. If NULL, all pages are processed.
- .prompt_fn An optional custom function that generates a prompt for each page. The function takes the page text as input and returns a string. If NULL, .general_prompt is used for all pages.

Value

A list of LLMMessages objects, each containing the text and image for a page.

perplexity	<i>Perplexity Provider Function</i>
------------	-------------------------------------

Description

The perplexity() function acts as a provider interface for interacting with the Perplexity API through tidyllm's chat() verb. It dynamically routes requests to Perplexity-specific function. At the moment this is only perplexity_chat()

Usage

```
perplexity(..., .called_from = NULL)
```

Arguments

- ... Parameters to be passed to the appropriate Perplexity-specific function, such as model configuration, input text, or API-specific options.
- .called_from An internal argument specifying which action (e.g., chat, embed) the function is invoked from. This argument is automatically managed by the tidyllm verbs and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked (e.g., an updated LLMMessages object for chat()).

perplexity_chat *Send LLM Messages to the Perplexity Chat API*

Description

This function sends a message history to the Perplexity Chat API and returns the assistant's reply.

Usage

```
perplexity_chat(
  .llm,
  .model = "sonar",
  .max_tokens = 1024,
  .temperature = NULL,
  .top_p = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .stop = NULL,
  .search_domain_filter = NULL,
  .return_images = FALSE,
  .search_recency_filter = NULL,
  .api_url = "https://api.perplexity.ai/",
  .json = FALSE,
  .timeout = 60,
  .verbose = FALSE,
  .stream = FALSE,
  .dry_run = FALSE,
  .max_tries = 3
)
```

Arguments

.llm	An LLMMessages object containing the conversation history.
.model	The identifier of the model to use (default: "sonar").
.max_tokens	The maximum number of tokens that can be generated in the response (default: 1024).
.temperature	Controls the randomness in the model's response. Values between 0 (exclusive) and 2 (exclusive) are allowed, where higher values increase randomness (optional).
.top_p	Nucleus sampling parameter that controls the proportion of probability mass considered. Values between 0 (exclusive) and 1 (exclusive) are allowed (optional).
.frequency_penalty	Number greater than 0. Values > 1.0 penalize repeated tokens, reducing the likelihood of repetition (optional).

.presence_penalty	Number between -2.0 and 2.0. Positive values encourage new topics by penalizing tokens that have appeared so far (optional).
.stop	One or more sequences where the API will stop generating further tokens. Can be a string or a list of strings (optional).
.search_domain_filter	A vector of domains to limit or exclude from search results. For exclusion, prefix domains with a "-" (optional, currently in closed beta).
.return_images	Logical; if TRUE, enables returning images from the model's response (default: FALSE, currently in closed beta).
.search_recency_filter	Limits search results to a specific time interval (e.g., "month", "week", "day", or "hour"). Only applies to online models (optional).
.api_url	Base URL for the Perplexity API (default: "https://api.perplexity.ai/").
.json	Whether the response should be structured as JSON (default: FALSE).
.timeout	Request timeout in seconds (default: 60).
.verbose	If TRUE, displays additional information after the API call, including rate limit details (default: FALSE).
.stream	Logical; if TRUE, streams the response piece by piece (default: FALSE).
.dry_run	If TRUE, performs a dry run and returns the constructed request object without executing it (default: FALSE).
.max_tries	Maximum retries to perform the request (default: 3).

Value

A new LLMMessages object containing the original messages plus the assistant's response.

rate_limit_info *Get the current rate limit information for all or a specific API*

Description

This function retrieves the rate limit details for the specified API, or for all APIs stored in the .tidyllm_rate_limit_env if no API is specified.

Usage

```
rate_limit_info(.api_name = NULL)
```

Arguments

.api_name	(Optional) The name of the API whose rate limit info you want to get If not provided, the rate limit info for all APIs in the environment will be returned
-----------	--

Value

A tibble containing the rate limit information.

send_azure_openai_batch

Send a Batch of Messages to Azure OpenAI Batch API

Description

This function creates and submits a batch of messages to the Azure OpenAI Batch API for asynchronous processing.

Usage

```
send_azure_openai_batch(  
  .llms,  
  .endpoint_url = Sys.getenv("AZURE_ENDPOINT_URL"),  
  .deployment = "gpt-4o-mini",  
  .api_version = "2024-10-01-preview",  
  .max_completion_tokens = NULL,  
  .reasoning_effort = NULL,  
  .frequency_penalty = NULL,  
  .logit_bias = NULL,  
  .presence_penalty = NULL,  
  .seed = NULL,  
  .stop = NULL,  
  .temperature = NULL,  
  .top_p = NULL,  
  .logprobs = NULL,  
  .top_logprobs = NULL,  
  .dry_run = FALSE,  
  .overwrite = FALSE,  
  .max_tries = 3,  
  .timeout = 60,  
  .verbose = FALSE,  
  .json_schema = NULL,  
  .id_prefix = "tidyllm_azure_openai_req_"  
)
```

Arguments

- .llms A list of LLMMessages objects containing conversation histories.
- .endpoint_url Base URL for the API (default: Sys.getenv("AZURE_ENDPOINT_URL")).
- .deployment The identifier of the model that is deployed (default: "gpt-4o-mini").
- .api_version Which version of the API is deployed (default: "2024-10-01-preview")
- .max_completion_tokens Integer specifying the maximum tokens per response (default: NULL).

.reasoning_effort	How long should reasoning models reason (can either be "low","medium" or "high")
.frequency_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency.
.logit_bias	A named list modifying the likelihood of specified tokens appearing in the completion.
.presence_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
.seed	If specified, the system will make a best effort to sample deterministically.
.stop	Up to 4 sequences where the API will stop generating further tokens.
.temperature	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
.top_p	An alternative to sampling with temperature, called nucleus sampling.
.logprobs	If TRUE, get the log probabilities of each output token (default: NULL).
.top_logprobs	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting an existing batch ID (default: FALSE).
.max_tries	Maximum number of retries to perform the request (default: 3).
.timeout	Integer specifying the request timeout in seconds (default: 60).
.verbose	Logical; if TRUE, additional info about the requests is printed (default: FALSE).
.json_schema	A JSON schema object provided by tidyllm schema or ellmer schemata (default: NULL).
.id_prefix	Character string to specify a prefix for generating custom IDs when names in .l1ms are missing (default: "tidyllm_azure_openai_req").

Value

An updated and named list of .l1ms with identifiers that align with batch responses, including a batch_id attribute.

send_batch

Send a batch of messages to a batch API

Description

The send_batch() function allows you to send a list of LLMMessages objects to an API. It routes the input to the appropriate provider-specific batch API function.

Usage

```
send_batch(
  .llms,
  .provider = getOption("tidyllum_sbatch_default"),
  .dry_run = NULL,
  .temperature = NULL,
  .timeout = NULL,
  .top_p = NULL,
  .max_tries = NULL,
  .model = NULL,
  .verbose = NULL,
  .json_schema = NULL,
  .seed = NULL,
  .stop = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .id_prefix = NULL
)
```

Arguments

.llms	A list of LLMMessages objects containing conversation histories.
.provider	A function or function call specifying the language model provider and any additional parameters. This should be a call to a provider function like <code>openai()</code> , <code>claude()</code> , etc. You can also set a default provider function via the <code>tidyllum_sbatch_default</code> option.
.dry_run	Logical; if TRUE, simulates the request without sending it to the provider. Useful for testing.
.temperature	Numeric; controls the randomness of the model's output (0 = deterministic).
.timeout	Numeric; the maximum time (in seconds) to wait for a response.
.top_p	Numeric; nucleus sampling parameter, which limits the sampling to the top cumulative probability p.
.max_tries	Integer; the maximum number of retries for failed requests.
.model	Character; the model identifier to use (e.g., "gpt-4").
.verbose	Logical; if TRUE, prints additional information about the request and response.
.json_schema	List; A JSON schema object as R list to enforce the output structure
.seed	Integer; sets a random seed for reproducibility.
.stop	Character vector; specifies sequences where the model should stop generating further tokens.
.frequency_penalty	Numeric; adjusts the likelihood of repeating tokens (positive values decrease repetition).
.presence_penalty	Numeric; adjusts the likelihood of introducing new tokens (positive values encourage novelty).

.id_prefix	Character string to specify a prefix for generating custom IDs when names in .llms are missing
------------	--

Value

An updated and named list of .llms with identifiers that align with batch responses, including a batch_id attribute.

send_claude_batch	<i>Send a Batch of Messages to Claude API</i>
-------------------	---

Description

This function creates and submits a batch of messages to the Claude API for asynchronous processing.

Usage

```
send_claude_batch(
  .llms,
  .model = "claude-3-5-sonnet-20241022",
  .max_tokens = 1024,
  .temperature = NULL,
  .top_k = NULL,
  .top_p = NULL,
  .stop_sequences = NULL,
  .json_schema = NULL,
  .thinking = FALSE,
  .thinking_budget = 1024,
  .api_url = "https://api.anthropic.com/",
  .verbose = FALSE,
  .dry_run = FALSE,
  .overwrite = FALSE,
  .max_tries = 3,
  .timeout = 60,
  .id_prefix = "tidyllm_claude_req_"
)
```

Arguments

.llms	A list of LLMMessages objects containing conversation histories.
.model	Character string specifying the Claude model version (default: "claude-3-5-sonnet-20241022").
.max_tokens	Integer specifying the maximum tokens per response (default: 1024).
.temperature	Numeric between 0 and 1 controlling response randomness.
.top_k	Integer for diversity by limiting the top K tokens.

.top_p	Numeric between 0 and 1 for nucleus sampling.
.stop_sequences	Character vector of sequences that halt response generation.
.json_schema	A schema to enforce an output structure
.thinking	Logical; if TRUE, enables Claude's thinking mode for complex reasoning tasks (default: FALSE).
.thinking_budget	Integer specifying the maximum tokens Claude can spend on thinking (default: 1024). Must be at least 1024. Defaults to "tidyllm_claude_req_".
.api_url	Base URL for the Claude API (default: "https://api.anthropic.com/").
.verbose	Logical; if TRUE, prints a message with the batch ID (default: FALSE).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting an existing batch ID associated with the request (default: FALSE).
.max_tries	Maximum number of retries to perform the request.
.timeout	Integer specifying the request timeout in seconds (default: 60).
.id_prefix	Character string to specify a prefix for generating custom IDs when names in .llms are missing.

Value

An updated and named list of .llms with identifiers that align with batch responses, including a batch_id attribute.

send_groq_batch *Send a Batch of Messages to the Groq API*

Description

This function creates and submits a batch of messages to the Groq API for asynchronous processing.

Usage

```
send_groq_batch(
  .llms,
  .model = "deepseek-r1-distill-llama-70b",
  .max_tokens = 1024,
  .temperature = NULL,
  .top_p = NULL,
  .frequency_penalty = NULL,
  .presence_penalty = NULL,
  .stop = NULL,
```

```

    .seed = NULL,
    .api_url = "https://api.groq.com//",
    .json = FALSE,
    .completion_window = "24h",
    .verbose = FALSE,
    .dry_run = FALSE,
    .overwrite = FALSE,
    .max_tries = 3,
    .timeout = 60,
    .id_prefix = "tidyllm_groq_req_"
)

```

Arguments

.llms	A list of LLMMessage objects containing conversation histories.
.model	Character string specifying the model to use (default: "deepseek-r1-distill-llama-70b").
.max_tokens	Integer specifying the maximum tokens per response (default: 1024).
.temperature	Numeric between 0 and 2 controlling response randomness.
.top_p	Numeric between 0 and 1 for nucleus sampling.
.frequency_penalty	Number between -2.0 and 2.0 to penalize repetition.
.presence_penalty	Number between -2.0 and 2.0 to encourage new topics.
.stop	One or more sequences where the API will stop generating further tokens.
.seed	An integer for deterministic sampling.
.api_url	Base URL for the Groq API (default: "https://api.groq.com//").
.json	Whether the response should be structured as JSON (default: FALSE).
.completion_window	Character string for the batch completion window (default: "24h").
.verbose	Logical; if TRUE, prints a message with the batch ID (default: FALSE).
.dry_run	Logical; if TRUE, returns the prepared request objects without executing (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting an existing batch ID (default: FALSE).
.max_tries	Maximum number of retries to perform the request.
.timeout	Integer specifying the request timeout in seconds (default: 60).
.id_prefix	Character string to specify a prefix for generating custom IDs when names in .llms are missing.

Value

An updated and named list of .llms with identifiers that align with batch responses, including a batch_id attribute.

send_mistral_batch *Send a Batch of Requests to the Mistral API*

Description

This function creates and submits a batch of messages to the Mistral API for asynchronous processing.

Usage

```
send_mistral_batch(
    .llms,
    .model = "mistral-small-latest",
    .endpoint = "/v1/chat/completions",
    .metadata = NULL,
    .temperature = 0.7,
    .top_p = 1,
    .max_tokens = 1024,
    .min_tokens = NULL,
    .frequency_penalty = NULL,
    .logit_bias = NULL,
    .presence_penalty = NULL,
    .seed = NULL,
    .stop = NULL,
    .safe_prompt = FALSE,
    .json_schema = NULL,
    .dry_run = FALSE,
    .overwrite = FALSE,
    .max_tries = 3,
    .timeout = 60,
    .id_prefix = "tidyllm_mistral_req_"
)
```

Arguments

.llms	A list of LLMMessages objects containing conversation histories.
.model	The Mistral model version (default: "mistral-small-latest").
.endpoint	The API endpoint (default: "/v1/chat/completions").
.metadata	Optional metadata for the batch.
.temperature	Sampling temperature to use, between 0.0 and 1.5 (default: 0.7).
.top_p	Nucleus sampling parameter, between 0.0 and 1.0 (default: 1).
.max_tokens	The maximum number of tokens to generate in the completion (default: 1024).
.min_tokens	The minimum number of tokens to generate (optional).
.frequency_penalty	Numeric value (or NULL) for frequency penalty.

.logit_bias	A named list modifying the likelihood of specific tokens (or NULL).
.presence_penalty	Numeric value (or NULL) for presence penalty.
.seed	Random seed for deterministic outputs (optional).
.stop	Sequence(s) at which to stop generation (optional).
.safe_prompt	Logical; if TRUE, injects a safety prompt (default: FALSE).
.json_schema	A JSON schema object for structured output (optional).
.dry_run	Logical; if TRUE, returns the prepared request without executing it (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting existing custom IDs (default: FALSE).
.max_tries	Maximum retry attempts for requests (default: 3).
.timeout	Request timeout in seconds (default: 60).
.id_prefix	Prefix for generating custom IDs (default: "tidyllm_mistral_req_").

Value

The prepared LLMMessages list with a batch_id attribute.

send_ollama_batch	<i>Send a Batch of Messages to Ollama API</i>
-------------------	---

Description

This function creates and submits a batch of messages to the Ollama API. Contrary to other batch functions, this function waits for the batch to finish and receives responses. The advantage compared to sending single messages via `chat()` is that Ollama handles large parallel requests quicker than many individual chat requests.

Usage

```
send_ollama_batch(
  .llms,
  .model = "gemma2",
  .stream = FALSE,
  .seed = NULL,
  .json_schema = NULL,
  .temperature = NULL,
  .num_ctx = 2048,
  .num_predict = NULL,
  .top_k = NULL,
  .top_p = NULL,
  .min_p = NULL,
  .mirostat = NULL,
  .mirostat_eta = NULL,
```

```

    .mirostat_tau = NULL,
    .repeat_last_n = NULL,
    .repeat_penalty = NULL,
    .tfs_z = NULL,
    .stop = NULL,
    .ollama_server = "http://localhost:11434",
    .timeout = 120,
    .keep_alive = NULL,
    .dry_run = FALSE
)

```

Arguments

.llms	A list of LLMMessages objects containing conversation histories.
.model	Character string specifying the Ollama model to use (default: "gemma2")
.stream	Logical; whether to stream the response (default: FALSE)
.seed	Integer; seed for reproducible generation (default: NULL)
.json_schema	A JSON schema object as R list to enforce the output structure (default: NULL)
.temperature	Float between 0-2; controls randomness in responses (default: NULL)
.num_ctx	Integer; sets the context window size (default: 2048)
.num_predict	Integer; maximum number of tokens to predict (default: NULL)
.top_k	Integer; controls diversity by limiting top tokens considered (default: NULL)
.top_p	Float between 0-1; nucleus sampling threshold (default: NULL)
.min_p	Float between 0-1; minimum probability threshold (default: NULL)
.mirostat	Integer (0,1,2); enables Mirostat sampling algorithm (default: NULL)
.mirostat_eta	Float; Mirostat learning rate (default: NULL)
.mirostat_tau	Float; Mirostat target entropy (default: NULL)
.repeat_last_n	Integer; tokens to look back for repetition (default: NULL)
.repeat_penalty	Float; penalty for repeated tokens (default: NULL)
.tfs_z	Float; tail free sampling parameter (default: NULL)
.stop	Character; custom stop sequence(s) (default: NULL)
.ollama_server	String; Ollama API endpoint (default: "http://localhost:11434")
.timeout	Integer; API request timeout in seconds (default: 120)
.keep_alive	Character; How long should the ollama model be kept in memory after request (default: NULL - 5 Minutes)
.dry_run	Logical; if TRUE, returns request object without execution (default: FALSE)

Details

The function provides extensive control over the generation process through various parameters:

- Temperature (0-2): Higher values increase creativity, lower values make responses more focused
- Top-k/Top-p: Control diversity of generated text
- Mirostat: Advanced sampling algorithm for maintaining consistent complexity
- Repeat penalties: Prevent repetitive text
- Context window: Control how much previous conversation is considered

Value

A list of updated LLMMessages objects, each with the assistant's response added if successful.

send_openai_batch *Send a Batch of Messages to OpenAI Batch API*

Description

This function creates and submits a batch of messages to the OpenAI Batch API for asynchronous processing.

Usage

```
send_openai_batch(  
  .llms,  
  .model = "gpt-4o",  
  .max_completion_tokens = NULL,  
  .reasoning_effort = NULL,  
  .frequency_penalty = NULL,  
  .logit_bias = NULL,  
  .presence_penalty = NULL,  
  .seed = NULL,  
  .stop = NULL,  
  .temperature = NULL,  
  .top_p = NULL,  
  .logprobs = NULL,  
  .top_logprobs = NULL,  
  .dry_run = FALSE,  
  .overwrite = FALSE,  
  .json_schema = NULL,  
  .max_tries = 3,  
  .timeout = 60,  
  .verbose = FALSE,  
  .id_prefix = "tidyllm_openai_req_"  
)
```

Arguments

.llms	A list of LLMMessages objects containing conversation histories.
.model	Character string specifying the OpenAI model version (default: "gpt-4o").
.max_completion_tokens	Integer specifying the maximum tokens per response (default: NULL).
.reasoning_effort	How long should reasoning models reason (can either be "low","medium" or "high")
.frequency_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on their existing frequency in the text so far.
.logit_bias	A named list modifying the likelihood of specified tokens appearing in the completion.
.presence_penalty	Number between -2.0 and 2.0. Positive values penalize new tokens based on whether they appear in the text so far.
.seed	If specified, the system will make a best effort to sample deterministically.
.stop	Up to 4 sequences where the API will stop generating further tokens.
.temperature	What sampling temperature to use, between 0 and 2. Higher values make the output more random.
.top_p	An alternative to sampling with temperature, called nucleus sampling.
.logprobs	If TRUE, get the log probabilities of each output token (default: NULL).
.top_logprobs	If specified, get the top N log probabilities of each output token (0-5, default: NULL).
.dry_run	Logical; if TRUE, returns the prepared request object without executing it (default: FALSE).
.overwrite	Logical; if TRUE, allows overwriting an existing batch ID associated with the request (default: FALSE).
.json_schema	A JSON schema object provided by tidyllm_schema or ellmer schemata (default: NULL).
.max_tries	Maximum number of retries to perform the request (default: 3).
.timeout	Integer specifying the request timeout in seconds (default: 60).
.verbose	Logical; if TRUE, additional info about the requests is printed (default: FALSE).
.id_prefix	Character string to specify a prefix for generating custom IDs when names in .llms are missing (default: "tidyllm_openai_req_").

Value

An updated and named list of .llms with identifiers that align with batch responses, including a batch_id attribute.

<code>tidyllm_schema</code>	<i>Create a JSON Schema for Structured Outputs</i>
-----------------------------	--

Description

This function creates a JSON schema for structured outputs, supporting both character-based shorthand and S7 `tidyllm_field` objects. It also integrates with `ellmer` types like `ellmer::type_string()` if `ellmer` is in your namespace

Usage

```
tidyllm_schema(name = "tidyllm_schema", ...)
```

Arguments

<code>name</code>	A character string specifying the schema name (default: "tidyllm_schema").
<code>...</code>	Named arguments where each name represents a field, and each value is either a character string, a <code>tidyllm_field</code> , or an <code>ellmer</code> type.
	Supported character shorthand types:
	<ul style="list-style-type: none"> • "character" or "string" for character fields • "logical" for boolean fields • "numeric" for number fields • "factor(...)" for enumerations • Use <code>[]</code> to indicate vectors, e.g., "character[]"

Value

A list representing the JSON schema, suitable for use with `.json_schema` in LLM API calls.

Examples

```
## Not run:
# Example using different field types
address_schema <- tidyllm_schema(
  name = "AddressSchema",
  Street = field_chr("A common street name"),
  house_number = field_dbl(),
  City = field_chr("Name of a city"),
  State = field_fct("State abbreviation", .levels = c("CA", "TX", "Other")),
  Country = "string",
  PostalCode = "string"
)
1lm_message("Imagine an address") |> chat(openai, .json_schema = address_schema)

# Example with vector field
tidyllm_schema(
```

```

plz = field_dbl(.vector = TRUE)
)

## End(Not run)

```

tidyllm_tool*Create a Tool Definition for tidyllm***Description**

Creates a tool definition for use with Language Model API calls that support function calling. This function wraps an existing R function with schema information for LLM interaction.

Usage

```
tidyllm_tool(.f, .description = character(0), ...)
```

Arguments

- .f The function to wrap as a tool
- .description Character string describing what the tool does
- ... Named arguments providing schema definitions for each function parameter using `tidyllm_fields`

Details

Each parameter schema in ... should correspond to a parameter in the wrapped function. All required function parameters must have corresponding schema definitions.

Value

A TOOL class object that can be used with `tidyllm chat()` functions

Examples

```

get_weather <- function(location){}
weather_tool <- tidyllm_tool(
  get_weather,
  "Get the current weather in a given location",
  location = field_chr("The city and state, e.g., San Francisco, CA")
)

```

voyage

Voyage Provider Function

Description

The `voyage()` function acts as a provider interface for interacting with the Voyage.ai API through `tidy1m`'s verbs. It dynamically routes requests to voyage-specific functions. At the moment this is only `voyage_embed()`

Usage

```
voyage(..., .called_from = NULL)
```

Arguments

...	Parameters to be passed to the appropriate Voyage-specific function, such as model configuration, input text, or API-specific options.
.called_from	An internal argument specifying which action (e.g., <code>embed</code>) the function is invoked from. This argument is automatically managed by the <code>tidy1m</code> verbs and should not be modified by the user.

Value

The result of the requested action, depending on the specific function invoked

voyage_embedding

Generate Embeddings Using Voyage AI API

Description

This function creates embedding vectors from text or multimodal inputs (text and images) using the Voyage AI API. It supports three types of input:

Usage

```
voyage_embedding(  
  .input,  
  .model = "voyage-3",  
  .timeout = 120,  
  .dry_run = FALSE,  
  .max_tries = 3,  
  .verbose = FALSE  
)
```

Arguments

.input	Input to embed. Can be:
	<ul style="list-style-type: none"> • A character vector of texts • An <code>LLMMessage</code> object (all textual components will be embedded) • A list containing a mix of character strings and <code>tidyllm_image</code> objects created with <code>img()</code>
.model	The embedding model identifier. For text-only: "voyage-3" (default). For multimodal inputs: "voyage-multimodal-3" is used automatically.
.timeout	Timeout for the API request in seconds (default: 120).
.dry_run	If TRUE, perform a dry run and return the request object without sending.
.max_tries	Maximum retry attempts for requests (default: 3).
.verbose	Should information about current rate limits be printed? (default: FALSE).

Details

1. Character vector: Embeds each text string separately
2. `LLMMessage` object: Extracts and embeds text content from messages
3. List of mixed content: Processes a combination of text strings and image objects created with `img()`

For multimodal inputs, the function automatically switches to Voyage's multimodal API and formats the response with appropriate labels (e.g., "[IMG] image.png") for images.

Value

A tibble with two columns: `input` and `embeddings`.

- The `input` column contains the input texts or image labels
- The `embeddings` column is a list column where each row contains an embedding vector

Examples

```
## Not run:
# Text embeddings
voyage_embedding("How does photosynthesis work?")

# Multimodal embeddings
list("A banana", img("banana.jpg"), "Yellow fruit") |>
  voyage_embedding()

## End(Not run)
```
