LaTeX package `eqnalign`

— — making `eqnarray(*)` look and work like `align(*)` — —

by Tom Hejda, `tohecz@gmail.com`

1 The goal

The goal of this package is to allow easy conversion from the insanely-looking `eqnarray` to the look and behaviour of `align` from `amsmath`. It is inspired by a TEX.StackEchange question `http://tex.stackexchange.com/q/96210/11002` by a user called "Werner", and by an answer of mine to the question.

2 The behaviour

The package is activated by simply loading it, and it does not have any package options. It just redefines eqnarray and eqnarray*, and then it makes `amsthm` aware of this redefinition so that \qedhere works inside these environments. At the same time, we keep the original definition od eqnarray and eqnarray* as EQNarray and EQNarray*, respectively. Note that `hyperref` modifies eqnarray, so the package shall be loaded after `hyperref`; this also means that `hyperref` tweaks do not make it into `EQNarray(*)`.

The main feature is implemented in a simple way: We keep track of & count, and we disable the 2nd & of each line. (Note that we also disable the 5th, 8th etc. ones.) We do it in a way that correctly interacts with cases such as when `array` or `matrix` is inside the environment.

3 License and remarks

(A) The package is licensed under the LaTeX Project Public License version 1.3c (LPPL v1.3c) or higher. The latest version of this license is in `http://www.latex-project.org/lppl.txt`.

(B) Note that actually, the usage of this package is discouraged, in favour of converting the code into proper "amsmath code", using the true `align` and `align*` environments. It is intended for cases where a lot of already existing code needs to be converted and there is no capacity for doing it the right but time-consuming way.

(C) All bugs shall be reported to the GitHub page `http://github.com/tohecz/eqnalign`. Just note that unless the bug is crucial or easy to deal with, it may not be fixed since (per the previous remark) single problematic cases shall be dealt with by other means.

4 Known issues

(1) Due to catcode changes, `eqnarray` will not work inside macro arguments and similar contexts.

(2) Note that as the package actually ignores the 2nd & of an `eqnarray` line, it in turn kills the alignment in cases such as the following:

```
\begin{eqnarray*}
  A & = & 104 x^5 + 84 x^4 + 53 x^3 \\
    &   & + 17 x^2 + 4 x - 1043
\end{eqnarray*}
```

$$A \quad = \quad 104x^5 + 84x^4 + 53x^3 \\ +17x^2 + 4x - 1043$$

This becomes, when `eqnalign` is loaded:

```
\begin{align*}
  A & = 104 x^5 + 84 x^4 + 53 x^3 \\
    & + 17 x^2 + 4 x - 1043
\end{align*}
```

$$A = 104x^5 + 84x^4 + 53x^3 \\ + 17x^2 + 4x - 1043$$

However, the prefered form would be, for instance:

```
\begin{align*}
  A & = 104 x^5 + 84 x^4 + 53 x^3 \\
    & \phantom{={}} + 17 x^2 + 4 x - 1043
\end{align*}
```

$$A = 104x^5 + 84x^4 + 53x^3 \\ + 17x^2 + 4x - 1043$$

This issue is actually somehow inherited from `align`, which in stardard usage shows the very same behaviour.

5 Implementation

Note that we in general say `eqnarray` where we really mean either `eqnarray` or `eqnarray*`.

1 ⟨∗package⟩

Package header.

2 \ProvidesPackage{eqnalign}[2017/02/19 v1.0a Make eqnarray(*) behave like align(*).]

The only necessary package is `amsmath` so that `align` and `align*` are defined.

3 \RequirePackage{amsmath}

The package does some catcode mysteries that shouldn't propagate out, so we make everything in a group and use `\gdef` everywhere.

4 \begingroup

\eqna@tab@amp We store a catcode-4 (tab alignment char) & in a macro. We need a catcode-13 (active) & througout the rest of the package.

5 \catcode`\&=4
6 \gdef\eqna@tab@amp{&}
7 \catcode`\&=13

\eqna@new@amp This will be the replacement of & inside `eqnarray`. We use `\eqna@amp@` if the innermost environment is `eqnarray` and `\eqna@tab@amp` otherwise; this is to allow things like arrays and matrices inside eqnarray.

8 \gdef\eqna@new@amp{%
9   \ifx\@currenvir\eqna@currenvir
10   \expandafter\eqna@amp@
11   \else
12   \expandafter\eqna@tab@amp
13   \fi
14 }

\eqna@amp@i
\eqna@amp@ii
\eqna@amp@iii
Three macros that are "rotated", after the first, the second shall be used, then the third. The third one ends a group since it ends a table cell, therefore after that the first one is again in action. The first & on a line is kept, the second is ignored, the third is kept.

15 \gdef\eqna@amp@i{\eqna@tab@amp\let\eqna@amp@\eqna@amp@ii}
16 \gdef\eqna@amp@ii{\let\eqna@amp@\eqna@amp@iii}
17 \gdef\eqna@amp@iii{\eqna@tab@amp}

\eqna@doamp The default is `\eqna@amp@i`.

```
18 \global\let\eqna@amp@\eqna@amp@i
```

\eqna@hook Hook exectuted at the beginning of eqnarray. We store the current environment, which is either eqnarray or eqnarray*; it is used in `\eqna@new@amp` for the test for nested environments. Then we activate & and make its meaning `\eqna@new@amp`.

```
19 \gdef\eqna@hook{%
20     \let\eqna@currenvir\@currenvir
21     \catcode`\&=\active
22     \let&\eqna@new@amp
23 }
```

Now we will be defining environments containing * in name, so we make it a letter.

```
24 \catcode`\*=11
```

\eqna@def@env
eqnarray
eqnarray*

We define a macro `\eqna@def@env` that contains the redefinitions of eqnarray (and eqnarray*). The environments themselves are like `align`, just hooked using `\eqna@hook`. We then call this macro immediately to define the environments. (All this fuss with `\eqna@def@env` is to correct things in case hyperref is loaded after eqnalign.

```
25 \gdef\eqna@def@env{%
26     \gdef\eqnarray{\eqna@hook\align}%
27     \gdef\eqnarray*{\eqna@hook\align*}%
28     \global\let\endeqnarray\endalign
29     \global\let\endeqnarray*\endalign*
30 }
31 \eqna@def@env
```

\eqnarray@qed
\eqnarray*@qed

To make amsthm's `\qedhere` work in eqnarray, we need to "hint" amsthm that it exists

```
32 \global\let\eqnarray@qed\align@qed
33 \global\let\eqnarray*@qed\align*@qed
```

End the group we began at the very beginning.

```
34 \endgroup
```

EQNarray Just of sentiment, we keep the original eqnarray as EQNarray; the code is a verbatim copy from ltmath.dtx (part of LaTeX 2_ε kernel).

```
35 \def\EQNarray{%
36     \stepcounter{equation}%
37     \def\@currentlabel{\p@equation\theequation}%
38     \global\@eqnswtrue
39     \m@th
40     \global\@eqcnt\z@
41     \tabskip\@centering
42     \let\\\@eqncr
43     $$\everycr{}\halign to\displaywidth\bgroup
44         \hskip\@centering$\displaystyle\tabskip\z@skip{##}$\@eqnsel
45       &\global\@eqcnt\@ne\hskip \tw@\arraycolsep \hfil${##}$\hfil
46       &\global\@eqcnt\tw@ \hskip \tw@\arraycolsep
47         $\displaystyle{##}$\hfil\tabskip\@centering
48       &\global\@eqcnt\thr@@ \hb@xt@\z@\bgroup\hss##\egroup
49         \tabskip\z@skip
50       \cr
51 }
52 \def\endEQNarray{%
53       \@@eqncr
54       \egroup
55       \global\advance\c@equation\m@ne
56     $$\@ignoretrue
57 }
58 \@namedef{EQNarray*}{\def\@eqncr{\nonumber\@seqncr}\EQNarray}
59 \@namedef{endEQNarray*}{\nonumber\endEQNarray}
```

Last but not least, if `hyperref` is loaded after `eqnalign` (and only in that case), we issue a warning since `hyperref` is doing bad things to `eqnarray`, and we redefine `eqnalign` once more.

```
60 \@ifpackageloaded{hyperref}{}{
61     \AtBeginDocument{
62         \@ifpackageloaded{hyperref}{
63             \@latex@warning{Package 'eqnalign' should be loaded after
64             'hyperref'.\MessageBreak Redefining 'eqnarray' and 'eqnarray*' at this
65             point \MessageBreak and crossing fingers...}
66             \eqna@def@env
67         }{}
68     }
69 }
```

That's all.

```
70 \endinput
```

```
71 ⟨/package⟩
```
