### Abstract

When writing a large manuscript, it is sometimes beneficial to repeat a theorem (or lemma or . . . ) at an earlier or later point for didactical purposes. However, `thmtools`'s built-in `restatable` only allows replicating theorems *after* they have been stated, and only in the same document. `reptheorem` solves the issue by making use of the `.aux` file, and also introduces its own file extension, `.thm`, to replicate theorems in other files.

## Contents

## 1    Repeating theorems

Let's say we define a theorem as follows:

```
\begin{theorem}[Yoneda Lemma]
    For \(F\colon \mathcal{C}\to \mathbf{Set}\) a functor,
    \(([\mathcal{C}^\mathrm{op},\mathbf{Set}](YA, F) \cong F(A)\)%
    for all objects \(A\) in \(\mathcal{C}\).
\end{theorem}
```

Its output is of course

**Theorem 1** (Yoneda Lemma)**.** *For $F\colon \mathcal{C} \to \mathbf{Set}$ a functor, $[\mathcal{C}^{\mathrm{op}}, \mathbf{Set}](YA, F) \cong F(A)$ for all objects $A$ in $\mathcal{C}$.*

Now let's say we want to replicate the theorem within the same document.
`makethm` (*env.*) That is what the new environment `makethm` is used for.

```
\begin{makethm}{theorem}{thm:Yoneda}[Yoneda Lemma]
    For \(F\colon \mathcal{C}\to \mathbf{Set}\) a functor,
```

---

[*]Version v1.3, last revised 2024-10-07.

```
    \([\mathcal{C}^\mathrm{op},\mathbf{Set}](YA, F) \cong F(A)\)
        for all objects \(A\) in \(\mathcal{C}\).
 \end{makethm}
```

Its output is the same (in fact, we've secretly used `makethm` in the previous example), but the important difference is that we have saved the theorem for later use.

The `makethm` environment takes two mandatory arguments and one optional one. The first mandatory argument is the type of theorem environment as defined in `amsthm`, like `theorem`, `lemma`, `definition`, etc. The second is the theorem's label. The label is mandatory since, to replicate the theorem, we need to have a "name" attached to it. `makethm` automatically attaches a `\label`, as well, so `\ref{thm:Yoneda}` becomes 1. The optional argument is passed right to the optional argument of the theorem environment, giving the theorem a name.

Now let's say we want to replicate the theorem later or earlier in the text. This may be done if, for example, the theorem is proven at a later point, or we want to "tease" the reader with a powerful theorem that will be proven later in the chapter. To do this, we use the `\repthm` command: `\repthm{thm:Yoneda}`. This outputs the theorem again.

\repthm

**Theorem 1** (Yoneda Lemma)**.** *For $F\colon\mathcal{C} \to \mathbf{Set}$ a functor, $[\mathcal{C}^{\mathrm{op}}, \mathbf{Set}](YA, F) \cong F(A)$ for all objects $A$ in $\mathcal{C}$.*

The label of this theorem is a `\ref`, and automatically links to the original theorem statement.

If the original theorem statement exists in a different file, or has not been created yet, we can add a placeholder alt text to the `\repthm` as an optional argument, which only displays if the theorem is undefined. For example, `\repthm{thm:foo}[bar]` returns

**Theorem ??.** *bar*

If we do the same without providing an alt text, we get

**Theorem ??.**

together with a warning: "Package `reptheorem`: Theorem `thm:foo` not defined; rebuild your project. If the issue persists, create the theorem using `\begin{makethm}` or consider adding alt text to `\repthm` using the optional parameter."

Since we're using the `.aux` file, it is possible to replicate a theorem before it is stated. For example,

```
 \repthm{thm:later}
 \begin{makethm}{theorem}{thm:later}
     Alligator!
 \end{makethm}
```

returns

**Theorem 2.** *Alligator*

**Theorem 2.** *Alligator*

Note that it is necessary to run a `.tex` file twice to replicate theorems ahead of time, similarly to how one has to run a file twice to make sure the references are correct.

## 2   Replicating theorems between files

Let's say we have the following files for our project:

```
foo.tex
bar.tex
```

**\theoremfile**   Let's say that we have defined a theorem `thm:baz` in `bar.tex`, and we want to replicate it in `foo.tex`. To achieve this, we first use the `\theoremfile` command in the preamble of `bar.tex`. This compiles all theorems defined in `bar.tex` and outputs them into a file `bar.thm`. To then import these into `foo.tex`, we use **\loadtheorems**   `\loadtheorems{bar.thm}` in the preamble, which loads all theorems saved in `bar.thm`. One can then use `\repthm` as usual.

Since the `.aux` file is loaded at `\begin{document}`, putting `\loadtheorems` in the preamble of a file will guarantee that the loaded theorem file will be overwritten by the theorems in the `.aux` file, i.e., theorems defined in the same document. In our example, if we also defined a `thm:baz` in `foo.tex`, loading `bar.thm` into `foo.tex` will not overwrite the local `thm:baz`.

### 2.1   Replicating theorems to subfiles

Replicating theorems to different files is particularly useful when working in big documents with multiple subfiles. For example, let's say we have the files

```
main.tex
foo.tex
bar.tex
```

Here, `main.tex` is generated by including `foo.tex` and `bar.tex` as chapters, creating a single large document. It is now possible to replicate theorems within the subfiles by running `\theoremfile` in `main.tex`, and then using `\loadtheorems{main.thm}` in `foo.tex` and `bar.tex`. This will allow us to use all theorems in the final `main.tex` in each of the subfiles.

## 3   Source code

```
1 ⟨∗package⟩
2 \ProvidesPackage{reptheorem}[2024-10-07 v1.3 Reptheorem package]
```

**\theoremfile**   Using `\theoremfile` will output all saved theorems into an output file. By default, if your LATEXfile is `foo.tex`, the output file is `foo.thm`.

```
3 \def\reptheorem@theoremfile{\relax}
4 \NewDocumentCommand{\theoremfile}{ O{\jobname.thm} }{
5 % O: the path of the file to which we should save theorems
6 %
7   \def\reptheorem@theoremfile{#1}
```

```
 8 \newwrite\@thmlist
 9 \immediate\openout\@thmlist=#1
10 }
```

**\loadtheorems** If you have exported saved theorems to a file, you can load them into another file using the macro \loadtheorems.

```
11 \NewDocumentCommand{\loadtheorems}{ m }{
12 \IfFileExists{#1}{
13  \input{#1}
14 }{
15  \PackageWarning{reptheorem}{%
16    File #1 not found. I will not import any theorems.%
17  }
18 }
19 }
```

**makethm** (*env.*) On to defining the actual theorems to be saved.

```
20 \NewDocumentEnvironment{makethm}{ m m o +b }
21 % m: the type of theorem environment
22 % m: the name of the theorem
23 % o: optional parameter for environment
24 % b: the content of the theorem
25 %
26 {%
27  \IfValueTF{#3}{% Check if theorem has optional arguments
28   \begin{#1}[#3]\label{#2}
29  }{
30   \begin{#1}\label{#2}
31  }
32 % \begin{theorem}
33   #4
34   \expandafter\gdef\csname thmtype@#2\endcsname{#1}%
35   \expandafter\long\expandafter\gdef\csname thm@#2\endcsname{#4}%
36   \IfValueT{#3}{% Only save theorem name if it exists
37    \expandafter\gdef\csname thmdesc@#2\endcsname{#3}%
38   }
39  % Saving parameters to aux file
40   \expandafter\long\expandafter\gdef\csname thmoutput@#2\endcsname{%
41    \string\expandafter\string\gdef\noexpand%
42    \csname thmtype@#2\string\endcsname{#1}%
43    ^^J%
44    \string\expandafter\string\long\string\expandafter%
45    \string\gdef\noexpand\csname thm@#2\string\endcsname{#4}%
46    \IfValueT{#3}{
47    ^^J%
48    \string\expandafter\string\gdef\noexpand%
49    \csname thmdesc@#2\string\endcsname{#3}%
50   }
51  }
52   \write\@auxout{\csname thmoutput@#2\endcsname}
53   \if\reptheorem@theoremfile\relax
54    % No file has been set
55   \else
56    % We have a theorem file
```

```
57      % Saving parameters to theorem file
58      \write\@thmlist{\csname thmoutput@#2\endcsname}
59    \fi
60  \end{#1}
61 }{}
```

\repthm  To repeat a theorem, use the \repthm command.

```
62 \newcounter{old@counter}
63 \NewDocumentCommand{\repthm}{ m +o }{
64 % m: the name of the theorem
65 % o: alt text
66 \begingroup
